# APPENDIX.

## DEAF AND DUMB.

### AUTHORS AND BOOKS.

THE number of books treating, expressly or incidentally, of the deaf and dumb, is much larger than those unacquainted with the subject would suppose. The brothers Guyot, of Groningen, published, in 1842, with the title of *Liste Littéraire Philologique*, a catalogue of authors, books, and institutions, filling more than five hundred octavo pages. The number of such books has greatly increased since. Dr. Day informs us that, in 1860, there were in the library of the Abbé Carton, of Bruges, (Belgium,) no less than five hundred treatises and other works on deaf-mute instruction, issued since the year 1837, and this was said to be far below the whole number issued. A large proportion of this number were, no doubt, reports of institutions, occasional addresses, magazine articles, and other ephemeral productions. Still there have appeared, both in Europe and America, a number of works of permanent interest and value to those interested in the deaf and dumb; some as records of the history of the art of deaf-mute instruction; some as giving correct views of the condition of the deaf and dumb, and of the principles on which their instruction should be based; others yet, presenting practical courses of lessons in language to lighten the labors of teachers. We will indicate the most remarkable of the works on the deaf and dumb known to us in the different languages of Europe.

We begin with Spain, for that country produced not only the first known teacher of deaf-mutes, (Pedro Ponce, who died 1584,) but also the first published treatise on the art, that of Jean Paul Bonet, published in 1620. But during the two centuries succeeding the appearance of Bonet's work, Spain has produced very little on this subject. The Manual of Ballasteros, the latest Spanish work on the deaf and dumb, published in 1836, contains a course of instruction chiefly borrowed from Sicard and Bébian.

Passing to Italy, we find that though an Italian philosopher, Jerome Cardan, half a century before the time of Ponce, stated the true theory on which the instruction of the deaf and dumb is possible, yet these unfortunates were practically neglected till the period of the general awakening to their claims, due to the labors and saintly zeal of De l'Épée. The work generally used in the Italian schools is a course of instruction by the Abbé Pendola, of Sienna, following also, for the most part, Sicard, Bébian, and other French teachers.

Great Britain presents more distinguished names. About the middle of the seventeenth century, several speculative writers, Bulwer, Dalgarno, and others, called public attention to the deaf and dumb, and explained the methods that might be used to instruct them. Dr. John Wallis, who began to teach a deaf-mute as early as 1660, has left, in his grammar and in the Philosophical Transactions, a clear and rational account of his processes, of which Braidwood availed himself to revive the art, a century later. The latter teacher, however, endeavored to keep his processes a secret; but his nephew, Dr. Joseph Watson, long at the head of the London asylum, published, in 1809, a valuable work on the education of the deaf and dumb. Of living English teachers, the most eminent seems to be Charles Baker, of Doncaster. Messrs. D. Anderson, of Glasgow, and James Cook, late of Edinburgh, have, as well as Dr. Baker, published series of lessons in language and reading-books, for the use of the deaf and dumb. David Buxton, of Liverpool, has made public the statistics of the deaf and dumb. The late Dr. Orpen, of Dublin, deserves to be commemorated; nor should we pass over Dr. Wilde, of the same city, who has published a valuable work on the diseases of the ear, and on the statistics of the deaf and dumb. A large quarto volume, put forth in 1857 by the London asylum, presents the most fully illustrated vocabulary of nouns, for the use of the deaf and dumb, known to us.

In Holland, after the early names of Von Helmont and John Conrad Amman, (the latter remarkable both for his extravagant views of the divine efficacy of speech, and for his accurate classification and description of vocal sounds, and directions for teaching articulation,) we find an interval of nearly a century, before Henry Daniel Guyot, (father of the compilers of the catalogue we have mentioned,) emulating the benevolent zeal of De l'Épée, transferred the method of the latter to Groningen.

In Belgium, the most distinguished name is that of the Abbé Carton, at Bruges. His writings are varied and numerous. He is, perhaps, better known for his benevolent efforts to instruct a blind deaf-mute, Anna Temmermans.

The other northern countries of Europe presenting little to detain us, we pass to Germany. Here authors and books multiply, but we have space to cite only a select few. Heinicke, the father of the German method, left very little in print, but his son-in-law, Mr. Reid, of Leipzig, has published works of value. The German teachers whose writings are esteemed of the most practical value, however, are Mr. Jaeger and Mr. Moritz Hill. O. F. Kruse, himself a deaf-mute, has given us biographical sketches of many distinguished deaf-mutes. Dr. Newmann, of Königsberg, deserves mention as an authority in the early history of the art.

France has also produced many works on the deaf and dumb. Those of De l'Épée and Sicard, though of world-wide reputation in their day, are now only consulted by the curious. The manual and the journal of Bébian are still of much

practical value for the sound philosophical principles they explain and illustrate. The elaborate work of the Baron Degerando may be useful to those wishing to study the history and theory of the art. The late Edouard Morel, as editor of the *Circulaires* and of the *Annales*, and Puybonnieux, as editor of the *Impartial*, deserve honorable mention. Piroux and Valade Gabel have published graduated series of lessons in language. The work of the latter, a few years since, attracted much attention by the illusory promise it held out of enabling the teachers of common schools to conduct successfully the education of deaf-mutes. Leon Vayssie will be presently mentioned among American teachers.

There have been also a few deaf-mute authors in France. Ferdinand Berthier, long the senior professor of the Paris institution, (reported to be recently deceased,) has published sundry well-written addresses, biographical sketches, &c. Pelissier, of the same institution, has given the world a volume of "*Poésies d'un Sourd Muet*." Claudius Forrester, principal of the school at Lyons, has published an extended volume of graduated lessons, in the French language, for the use of his pupils, in which he has endeavored to carry out the principles of his master, Bébien.

It seems proper, in a national publication destined as an authentic record for scholars and men of science, to give a more particular account of those who, in the United States, have most distinguished themselves as laborers in the cause of the unfortunate deaf and dumb, and of the most important works they have given to the world.

Thomas Hopkins Gallaudet, LL.D., was of French-Huguenot descent, and was born in the city of Philadelphia, December 10, 1787. His parents removed, while he was a boy, to Hartford, Connecticut, the scene of his future labors and renown. Of a delicate constitution, but of great intellectual promise, he made unusually rapid progress in his early studies, and graduated at Yale College with distinction before he had completed his eighteenth year. During the next ten years he tried the study of law, served for a year or two as a tutor in his Alma Mater, engaged for a season in commercial pursuits, and, finally, settling down in the conviction that his vocation was the Christian ministry, spent the three years, from 1811 to 1814, in the theological seminary at Andover, Massachusetts, from which he graduated with high honor.

During his term at Andover, he became providentially interested in the case of a little daughter of Dr. Cogswell, a neighbor of his father, at Hartford, who had become deaf at the age of two years, and consequently soon became mute. Meeting the child during one of his vacations, he showed such aptitude to communicate with her, and teach her the meaning of written words, that her friends were encouraged to hope that she might, through his aid, escape the fearful doom of ignorance and degradation so long considered the inevitable lot of the deaf and dumb.

Reports of the success of some European teachers of deaf-mutes had reached this country, but little was known of their processes. Benevolent men were found in Hartford, who contributed the means to send Mr. Gallaudet to acquire and bring to America the system of instruction matured by half a century of study and experience in Europe.

Mr. Gallaudet hesitated to relinquish his prospects of distinction and usefulness as a preacher, till, by means of statistical information, the first of the kind ever collected in America, he obtained some glimpses of the hitherto unimagined greatness of this new field of benevolent effort. It was ascertained, through the congregational clergy of Connecticut, that there were more than eighty deaf-mutes in that State alone, and it was reasonably assumed that a like proportion existed in the other States. Finding that the deaf and dumb of America—heathen in a Christian land—probably numbered thousands, Mr. Gallaudet accepted the call to become the pioneer in this new department of benevolent labor.

Arriving in England a few days after the battle of Waterloo, the unsettled state of France, united with the strong interest he took in the alleged restoration of the dumb to speech, determined his first applications to the schools that practiced the methods of Braidwood, whose success in teaching articulation had been highly extolled, and, probably, not a little exaggerated. But he was repelled by the onerous conditions prescribed by the narrow and monopolizing spirit of the successors of Braidwood, and turned his attention to the school of the Abbé Sicard, at Paris—providentially, as we hold, for he there acquired a better theory of instruction, leading to the cultivation of that language of gestures, which must ever be the main instrument of instruction, and best means of religious culture and social enjoyment, for the deaf and dumb; and at Paris he secured the services of Laurent Clerc. Through the influence of Bébien, the more fanciful of Sicard's processes were already falling into disuse, and the method which Clerc brought to America was more rational and practical than that set forth in the works of his master.

Returning to America in August, 1816, Messrs. Gallaudet and Clerc made a successful tour to collect funds from the benevolent, (a then necessary resource, superseded in a few years by a donation of lands from Congress and by appropriations from the State legislatures,) and opened, at Hartford, the first American asylum for the education and instruction of the deaf and dumb, in April, 1817. Mr. Gallaudet continued at the head of the American asylum till 1830, when the state of his health induced him to relinquish a post requiring such arduous labor. Subsequently he employed himself in writing books for the young; took part in the establishment and management of a female seminary; and was, for the last thirteen years of his life, chaplain of the Retreat for the Insane, at Hartford. He also took an active and influential part in the establishment of normal schools, and in other measures for the improvement of our system of common schools. His useful life closed September 10, 1861, at the age of sixty-four.

Mr. Gallaudet married, in 1822, a deaf-mute lady, one of his earliest pupils. None of their children inherited their mother's misfortune. Two of them are distinguished laborers in the cause of the deaf and dumb.

The published writings of Mr. Gallaudet are quite numerous, but the proportion specially designed for the use of the deaf and dumb, or even treating of them, is small. When we recollect his ability as a ready and graceful writer, and the number of books for the young from his pen, it is matter of surprise and regret to find that he published so little adapted to

enlighten the public mind either on the history or processes of the art of deaf-mute instruction, and that he merely printed a few crude essays towards language lessons for his pupils. Still, his memory is reverentially cherished by his pupils and by the deaf and dumb of the whole Union. Having testified their affectionate gratitude, during his lifetime, by the presentation of a service of plate, they, after his death, by contributions from the graduates and pupils, not merely of the asylum at Hartford, but of all the kindred schools in the Union, raised to him a monument on the grounds of the American asylum, with this inscription: "Erected to the Memory of the Rev. Thomas Hopkins Gallaudet, LL.D., by the Deaf and Dumb of the United States, as a Testimonial of Profound Gratitude to their Earliest and Best Friend and Benefactor."

Thomas Gallaudet, D. D., eldest son of Rev. Thomas H. Gallaudet, became, in 1843, at the age of twenty, and continued for fifteen years, a professor in the New York Institution for the Deaf and Dumb. The son of a deaf-mute mother, and himself marrying a deaf-mute, he took a warm interest in the spiritual and temporal welfare of the deaf and dumb, who, after leaving school, find themselves in a great measure cut off from religious privileges, and at a disadvantage in the competition for employment. This interest led to his gradually assuming the duties of pastor to a deaf-mute congregation; and, finally, as the result of his labors, a church and congregation were built up, called "St. Ann's Church for Deaf-Mutes," (connected with the Episcopal denomination,) into which most of the deaf and dumb living in New York city and vicinity have been gathered, with a number of families sufficient to make a respectable parish, some containing deaf-mute children, others attracted by benevolent interest in the work. Of this church Dr. Gallaudet is rector. The church and parsonage are on Eighteenth street, near Fifth avenue, and cost seventy thousand dollars.

Here is probably the only church in the world gathered and conducted with a special regard to the interests of deaf-mutes, and where regular services are held for the benefit of the deaf-mute portion of the congregation in their own language of signs. In addition to his labors as pastor, and as the temporal friend and adviser of the deaf and dumb, Dr. Gallaudet frequently visits other cities, and gives religious services in the language of signs wherever a number of deaf-mutes can be collected.

Edward M. Gallaudet, principal of the Columbian Institution, at Washington, is another son of the venerated founder of the American asylum. The flourishing condition of the institution under his care attests his hereditary ability and zeal as an instructor of the deaf and dumb.

Laurent Clerc, the best pupil of the celebrated Abbé Sicard, and the oldest teacher of the deaf and dumb in the United States, was born in Dauphiny, France, in 1785. His parents ascribed the total loss of the two senses of hearing and smell to his having fallen into the fire when about a year old, receiving a severe burn on the side of his face. At the age of twelve he entered the school of the Abbé Sicard, who, a few years previously, had succeeded the benevolent De l'Épée. The Abbé, recognizing the uncommon abilities of young Clerc, retained him as a teacher, at a very moderate salary, however, though in a few years he was thought competent to teach the highest class, and was pronounced, by no less an authority than that of the celebrated Bèbian, the "glory and support" of the institution of Paris. This exiguity of salary, combined with the noble ambition of carrying the blessings of education to his deaf-mute brethren in another hemisphere, disposed him to accept readily the proposal of Mr. Gallaudet, as already related, and secured to the infancy of deaf-mute instruction in America the services of one of the best qualified teachers then living. Mr. Clerc has the merit of having taught the language of signs and the processes of instruction to most of the early American teachers of the deaf and dumb. After more than half a century of faithful labor in his vocation, (including ten years in the Parisian school,) he retired, in 1858, from active duty, and enjoys, at a green old age, the ease and universal respect so well earned. He married a deaf-mute, and has four children blessed with all their faculties, and respectable and useful members of society. Mr. Clerc has published, in the "American Annals of the Deaf and Dumb," some interesting reminiscences of his early friend and school-fellow, Massieu, and of his own visit to Europe. His style, for a born deaf-mute, is remarkably correct and perspicuous.

Lewis Weld, A. M., descended from a line of New England ministers, was one of the earliest associates of Mr. Gallaudet in the American asylum. In 1822 he was called to conduct the Pennsylvania institution, and in 1830 was summoned back to Hartford as the successor of Mr. Gallaudet. He continued at the head of the American asylum till his death, December 30, 1853, at the age of fifty-seven. In 1844 he visited many of the schools for deaf-mutes in Europe, mainly with the view of ascertaining what success was obtained in teaching articulation, and published the result of his observations in a valuable report appended to the twenty-ninth report of the American asylum. The general result of his observations was decidedly unfavorable to the teaching of articulation to the deaf and dumb, unless in rare exceptional cases.

Rev. William Wolcott Turner was elected principal of the American asylum, as the successor of Mr. Weld, and held that office till the present summer, (1863,) when he retired. He had been an instructor in the American asylum since 1821, and was thus, since the retirement of Mr. Clerc, the senior of American teachers of deaf-mutes. The present flourishing condition of that venerable school attests the tact and ability of its late experienced principal. Mr. Turner attended most of the conventions of American teachers of the deaf and dumb, taking a leading part in the discussions, and has been a frequent contributor to the *Annals*.

Lucerne Rac, an accomplished instructor in the American asylum, and for several years the editor of the *American Annals of the Deaf and Dumb*, died September 16, 1854, in his forty-third year.

Samuel Porter has been many years a teacher, first in the American asylum, afterwards in the New York institution, and again in the asylum, from which he retired two or three years since to devote himself to literary pursuits. As the successor of Mr. Rac, he edited the *American Annals of the Deaf and Dumb* with much ability for several years. He has also written occasional articles for newspapers and reviews, adapted to diffuse correct views concerning the condition and best mode of instructing the deaf and dumb. His anonymous article on the "Education of the deaf and dumb," in the *American Review*

for May, 1846, presents an admirably condensed view of the subject, especially of the observations of Mr. Weld and Mr. Day on the European articulating schools.

Harvey Prindle Peet, LL.D., was born at Bethlehem, Connecticut, November 19, 1794. A farmer's son, working himself on his father's farm in summer, and teaching a district school in winter, in those years while other youth are in college, his early advantages of education were very restricted, but by native force of mind and character, strengthened by this rough discipline, he worked his way to a liberal education, and graduated with distinction at Yale College, in 1822. His views were directed to the Christian ministry, but an invitation to engage in the instruction of the deaf and dumb in the American asylum, gave him the opportunity of discovering his rare fitness for this new profession. He continued in this school nine years, and acquired a reputation for eminent efficiency, both as a teacher of a class and as the steward of the asylum, which led to his receiving, in the beginning of the year 1831, the appointment of principal of the New York institution, which had been for some years declining in public estimation, owing to incompetent management. Under the care of Mr. Peet, this institution, in a few years, attained the very highest rank among similar institutions on either side of the Atlantic.

As a teacher, Dr. Peet was distinguished for his perfect control over his pupils, even the rudest and most wilful newcomers, and by his ability to command their attention, excite their mental powers, and make durable impressions on their memories. Very few teachers of deaf-mutes have equalled him in mastery of the language of gestures, or in the ability to convey ideas, clearly and impressively, in that language. Though a strict disciplinarian, he has ever been regarded as a friend and father by his pupils.

The benefits of the long and zealous labors of Dr. Peet have not been confined to his own institution. Teachers trained by him have carried his improved methods of instruction to many schools at the south and west, and his series of elementary works have lightened the labors of the teachers and promoted the progress of the pupils in nearly all the institutions for deaf-mutes in the United States and in British America. Dr. Peet took a leading and efficient part in originating the conventions of American teachers of the deaf and dumb, of which five have been held—at New York, in 1850; at Hartford, in 1851; at Columbus, Ohio, in 1853; at Staunton, Virginia, in 1855; and at Jacksonville, Illinois, in 1858. Dr. Peet attended all these conventions, presenting papers of great permanent value at each, and taking a leading part in the discussions, thus putting on record, in their published proceedings, the fruits of his long experience and rare judgment, for the benefit of his professional brethren. He has also been a frequent and voluminous contributor to the *American Annals of the Deaf and Dumb*, discussing, among other topics, the best course of instruction, the superiority of natural, or colloquial, to methodical signs,\* and the qualifications of the principal of an institution. In the summer of 1851, Dr. Peet visited many of the European institutions for deaf-mutes, and gave the result of his observations in a very valuable report annexed to the thirty-third report of the New York institution. He has been a zealous and diligent collector of the statistics of the deaf and dumb, and has given to the world, in connexion with some of the New York reports, especially the thirty-fourth, thirty-fifth, and forty-fourth, the fullest collections of such statistics extant.

It may truly be said that the publications of Dr. Peet for the benefit of the deaf and dumb surpass, in number, extent, and value, not merely those of any other American teacher, but those of all other American teachers together. The following list embraces only the most important. Others are briefly indicated above.

1. *Elementary Lessons, being a Course of Instruction for the Deaf and Dumb, Part I.* This little volume of graduated lessons in language, on a principle of philosophical progress, of which the first edition appeared in 1844, was welcomed with a satisfaction amounting to enthusiasm, has passed through several editions, and is still the only text-book in the instruction of the younger classes in most of the schools for the deaf and dumb in the United States and in British America. It has also been found a very attractive first book for little children who hear; and missionaries have proved its value in giving the first lessons in the English language to their little heathen pupils.

2. *Course of Instruction, Part II.*

3. *Course of Instruction, Part III.* These two volumes lead the pupil through the difficulties of language, by a gradual progression, to the point where he can advantageously use books prepared for children who have already acquired through the ear that language which costs the deaf-mute such severe labor to acquire through the eye.

4. *Scripture Lessons for the Deaf and Dumb.*

5. *Address at the Dedication of the Chapel of the New York Institution, December 2, 1846.*

6. *Address at the laying of the corner-stone of the North Carolina Institution for the Deaf and Dumb, April 14, 1848.* These two instructive and eloquent addresses treat of the contrast between the uneducated and the educated deaf and dumb, and give an admirably condensed sketch of the rise and progress of the art of instructing them, and of the method of instruction.

7. *Memoir on the Origin and Early History of the art of instructing the Deaf and Dumb*, presented at the first convention, and reprinted in the *American Annals* for April, 1851.

8. *Memoir on the History of the art of instructing the Deaf and Dumb, Second Period.* This paper, a continuation of the preceding, occupies more than sixty pages in the proceedings of the fifth convention. The two form the best sketch extant of the history of deaf-mute instruction, especially as to its earlier periods.

9. *Report on European Institutions for the Deaf and Dumb*, annexed to the thirty-third New York report.

10. *Report on the Legal Rights and Liabilities of the Deaf and Dumb.* This is a monograph of great interest and

\* By *methodical signs* is technically understood signs made in the order of words, and with variations corresponding to the inflection of words; hence, different from the signs used by deaf-mutes in conversation.

value, not merely the best, but probably the only complete treatise on that subject, adapted to the use of English and American lawyers. It was presented at the fourth convention, in the published proceedings of which it occupies more than a hundred pages. An imperfect copy appeared in the American Journal of Insanity in the summer of 1856.

11. Notions of the Deaf and Dumb before Instruction, especially on Religious Subjects. This remarkable article appeared in the Bibliotheca Sacra, for July, 1855, and was republished in the American Annals of the Deaf and Dumb, for October, 1855. A fuller account of Dr. Peet and his valuable labors will be found in the American Journal of Education, for June, 1857.

Isaac Lewis Peet, M. A., has been a professor in the New York institution since 1845. In 1851 he accompanied his father in his visit to the schools of Europe, on which occasion, says Dr. Peet in his report, "his attainments, as a linguist, made his services, during our continental tour, singularly useful," and adds that much of the merit of the report was due to him. When, the following year, a high class was established in the New York institution, for the benefit of such deaf-mutes as, after going through the ordinary course of instruction, might show a capacity for being benefited by an additional course of higher studies, he was selected as the teacher of this class, making him *ex officio* vice-principal of the institution. For impressing on his deaf-mute pupils the laws of grammar and the structure of written language, Professor Peet makes much use of Barnard's Grammatical Symbols, of which he has given an able exposition in a paper printed in the proceedings of the third convention. He is, moreover, the author of a new and philosophical system of grammatical analysis, which not only materially simplifies the labor of teaching language to the deaf and dumb, but will undoubtedly supersede the ordinary methods of teaching grammar to those who hear.

Edward Peet, M. A., second son of Dr. Peet, was, for more than thirteen years, a professor in the New York institution, and was an able, faithful, and successful teacher. He contributed to the American Annals papers on Degerando and Itard, chiefly translated from the French. For several years he devoted his leisure to the preparation of an arithmetic for the use of his pupils, a work of much merit both as respects its lucidity of illustration and arrangement, and the happy choice of examples. It is used in the institution in manuscript. He died January 27, 1862, at the early age of thirty-five.

Dudley Peet, M. D., youngest son of Dr. Peet, after graduating at Yale College, studied medicine at the College of Physicians and Surgeons in New York. He practiced his profession for a year or two at Burlington, Iowa, and then accepted an appointment as professor in the New York institution, for the duties of which post he was eminently qualified. His death, by pulmonary disease, aggravated by his self-sacrificing labors in behalf of the deaf and dumb, April 18, 1862, at the early age of thirty-two, was an irreparable loss to the cause of deaf-mute instruction. He left us a Dissertation on the Remote and Proximate Causes of Deafness, published in the American Annals for April, 1856, and a Monograph on the Infinitive Mood, designed as part of a grammar for the use of the deaf and dumb, which is used in manuscript in the higher classes of the New York institution.

John R. Burnet is a farmer, residing in Livingston, New Jersey. He lost his hearing, at the age of eight, by an attack of inflammation of the brain. Thus cut off from social intercourse, he was driven to books. He served for a time as a teacher in the New York Institution for the Deaf and Dumb, and afterwards married a deaf-mute pupil of that institution. He has thus, from personal experience and reading, an intimate acquaintance with the characteristics of deaf-mutes, and the history and principles of the art of instructing them. He has been a frequent contributor to the American Annals, and has also furnished articles on the deaf and dumb to the North American Review (April, 1844) and the Biblical Repository (October, 1842.) His first attempt at authorship was a little volume (long since out of print) published at Newark, New Jersey, in 1835, with the title: "Tales of the Deaf and Dumb, with Miscellaneous Poems."

John Carlin, a deaf-mute from birth, and one of the earliest pupils of the Philadelphia school, though not a teacher, deserves mention for his uncommon attainments in language. He reads French and one or two other languages, and writes English with an ease and correctness quite remarkable in a deaf-mute from birth. He has been an occasional contributor to the Annals, and has written largely for the newspapers, especially for the "Gallaudet Guide," a monthly published for two or three years by deaf-mutes at Boston and Hartford. Mr. Carlin married a deaf-mute, and has several children, all free from the infirmity of their parents. He is a miniature painter in New York city, in which occupation he was very successful before the growing perfection of photography crowded the pencil and brush from the field of competition.

James Nack became totally deaf from a fall, at the age of eight. He has long been employed as a searcher of records in the county clerk's office, New York city. He has been a voluminous writer of poetry for newspapers and magazines, and at four different times published his select poems in neat volumes.

Levi S. Backus, a deaf-mute, has, for nearly thirty years, been editor and proprietor of a weekly newspaper, the Canajoharie (New York) Radii.

Samuel Akerly, M. D., was an early and efficient friend of the deaf and dumb, and did more than any other man to promote the foundation of the New York institution. He devoted the latter years of his life to the building up of the New York Institution for the Blind. He died in July, 1846. Besides reports and addresses, and a paper on the curious coincidences between the signs of the deaf and dumb and those used among the western aboriginal tribes, he compiled a volume of Elementary Exercises for the Deaf and Dumb, (1821.)

Frederick Augustus Porter Barnard, LL.D., a native of Sheffield, Massachusetts, and a graduate of Yale College became an instructor in the American asylum in 1831, and transferred his services to the New York institution in the following year. Here he co-operated zealously and ably with Dr. Peet, and Messrs. Vaisse, Bartlett, Cary, and Day, in simplifying

and improving the method of instruction, especially in throwing off the old incumbrances of methodical signs. He contributed to the North American Review (April, 1834) a valuable article of eighty pages, headed "Observations on the Deaf and Dumb," and also an article on the "Existing state of the Art of Instructing the Deaf and Dumb," in the Literary and Theological Review for September, 1835. He improved and reduced to system the grammatical symbols elaborated by successive teachers from the theory of ciphers of the Abbé Sicard, and embodied them in a valuable English grammar which he published in 1836, with the title of "Analytical Grammar, with Symbolic Illustration," a work still used in the New York institution. In 1838 he accepted a professorship in the University of Alabama, and some fifteen or twenty years later became president of the University of Mississippi.

Leon Vaisse, after serving four years as a teacher in the Institution of Paris, was invited to America, and brought to the New York institution, in which he served four years very acceptably, a knowledge of the improvements made in the art of instruction by Bèbian, Degerando, and other able successors of Sicard. Returning to his native country in 1834, and re-assuming a professorship in the Parisian institution, he has risen to the position of professor of the *Classe de Perfectionnement*, corresponding to the high class in an American school. He has published many short but well written articles on the deaf and dumb. At one time he devoted much labor to the teaching of a selected class in articulation, and published a little *brochure* in which the mechanism of speech was visibly illustrated, accompanied by an alphabet, the letters of which imitated or suggested the positions of the vocal organs in uttering them. He has also given us a system of grammatical symbols differing somewhat from that used in the New York institution.

Rev. Josiah Addison Cary, a native of West Brookfield, Massachusetts, and a graduate of Amherst College, was for nineteen years, one of the most accomplished and efficient professors in the New York Institution for the Deaf and Dumb. In 1851 he was appointed superintendent of the Ohio institution, as the successor of its founder, Rev. H. N. Hubbell. His bright course of virtue and usefulness was prematurely closed by a rheumatic affection, taking the form of *ankylosis*, and finally locking up nearly all motion. Still, he continued to perform the duties of his office till within a few days of his death, August 7, 1852, at the early age of thirty-nine. Though he left us no considerable work, his contributions to the newspapers, adapted to call public attention to the subject of deaf-mute education, were numerous and well worth preservation. He prepared valuable book notices appended to some of the New York reports. There is a curious paper of his on deaf-mute idioms in the proceedings of the second convention.

John A. Jacobs, A. M., has been for nearly forty years at the head of the Asylum for the Deaf and Dumb, at Danville, Kentucky, and has distinguished himself for his benevolent zeal in the cause of the mute. He learned the language of signs and the processes of instruction from Mr. Clerc and Mr. Gallaudet, at Hartford. He published, as early as 1834, a little book of "Lessons for the Deaf and Dumb," and gave to the press a more carefully prepared work, in 1860, under the title of "Primary Lessons for Deaf-Mutes." Mr. Jacobs has also been a frequent contributor to the *Annals*, particularly distinguishing himself for his zeal in defence of *methodical signs*, which he holds, against the evidence of experience and the opinions of most teachers, to be necessary for the deaf-mute as a connecting link between words and ideas.

George Edward Day, D. D., (now and for some years past professor of biblical literature in Lane Theological Seminary, near Cincinnati, Ohio,) is a native of New Haven and a graduate of Yale College. Though the youngest, he was one of the best scholars of his class. He acquired, in the New York institution, during two years' service as a teacher, (1833 to 1835,) a more than commonly correct and extensive knowledge of the theory, practice, and history of deaf-mute instruction. This qualification, joined to his eminent ability as an investigator and a writer, and his familiar knowledge of the French and German languages, pointed him out as the proper man to make an examination of the European schools for the deaf and dumb, with the view of comparing results with those attained in our own schools, and of suggesting improvements, if their methods should be found in any respect superior to our own. In 1844 he visited many of those in England and Germany, and in 1860 his attention was chiefly given to the schools in Holland and the Institution of Paris. On each occasion he made reports, (annexed to the reports of the New York institution for those years, the twenty-sixth and forty-second,) which are documents of great and permanent value—the first especially, which embraces a full description of the German methods of instruction, including the most approved processes for teaching articulation to deaf-mutes. The conclusion to which Dr. Day arrived was, that our system, judged by its results, is superior to those of the English, German, and Hollandish schools, and that the teaching of articulation seldom yields results of any practical value to the pupil in the intercourse of society after leaving school, while it exacts a waste of time, and a restriction on the development of the pupil's favorite language of signs, that materially cramp his mental improvement and his social enjoyments. It is a significant fact that in England the teaching of articulation to the deaf and dumb, once considered an indispensable part of the system of instruction, has been, for many years, going more and more into disfavor and disuse.

David E. Bartlett has been more than thirty years at Hartford in the American asylum, in the New York institution, as the head of a private school for deaf-mute children, and again in the American asylum. He is distinguished for his expertness and eloquence in the language of signs.

Oran W. Morris is also a teacher of more than thirty years' experience, chiefly in the New York institution, where he is still a professor. He served, about ten years ago, a year or two as head of the Tennessee school.

Rev. B. M. Fay, formerly of the New York institution, is now head of the Michigan institution.

James S. Brown, reported to be recently deceased, was successively at the head of the Indiana and Louisiana institutions.

Abraham B. Hutton, more than thirty years at the head of the Pennsylvania institution, is universally esteemed as well for ability and success in his profession, as for the worth of his private character.

Rev. Collins Stone went from the American asylum, in 1852, as the successor of Mr. Cary in the superintendency of the Ohio institution. He has been very recently recalled to Hartford, as the successor of Mr. Turner.

Jacob Van Nostrand went from the New York institution to organize the Texas institution.

William D. Cooke, a native of Vermont, was the founder of the North Carolina institution, from which he has, within two or three years, transferred his services to the Georgia institution.

## THE BLIND.

### PERSONS IN AMERICA AND EUROPE WHO HAVE DEVOTED SPECIAL ATTENTION TO THE INTERESTS OF THE BLIND.

BELIEVING that brief biographical sketches of those who have done most for the improvement of the condition of the blind would not only prove interesting and instructive, in this connexion, but be an incentive to beneficence, we subjoin the following:

Valentin Haüy, called by French writers "the Apostle of the Blind," was the originator of schools for the free instruction of blind persons. He was a younger brother of the celebrated mineralogist, the Abbé Rene Haüy, and was the son of a poor weaver in the village of St. Just, Picardy, France. He was born November 13, 1745, and educated, at first through the intervention of some benevolent monks of a neighboring monastery, in the schools of his native village, and afterward at one of the colleges of Paris. His aptitude for classic and linguistic studies is said to have been remarkable. After completing his collegiate course, he soon received an appointment in the bureau of foreign affairs, and for nearly twenty years filled the post of translator of despatches. It was not till his thirty-eighth year that he became interested in the instruction of the blind, and his attention was called to the subject by an incident which, though trivial in itself, changed the whole tenor of his subsequent life.

The proprietor of a café in one of the principal thoroughfares, desirous of attracting a larger amount of custom, procured, at a trifling compensation, the services of eight or ten blind men, whom he arranged before a long desk, with leather spectacles on nose, and instruments in their hands, and placing open music books before them, from which they feigned to read, caused them to execute the most horrible discords upon their instruments, in the true use of which they were entirely unskilled. This performance drew together a large crowd, who, while laughing over the discordant sounds, patronized the café. Among these spectators was Valentin Haüy; but the sight, far from exciting his mirth, led him to reflect on the possibility of instructing these unfortunate persons in letters and music.

There was then in Paris a German lady of high rank, Mademoiselle de Paradis, who, though blind from the age of two years, had, by the efforts of her friends and the inventive genius of the printer Weissenburg, of Mannheim, been enabled to acquire a good education, and, by means of pin types, could communicate with her absent friends. Haüy had formed the acquaintance of this estimable lady, and at this time (1784) he communicated to her his desire to instruct the blind poor, and sought her advice as to the best method of accomplishing it. She readily gave him the counsel he sought, and, after maturing his plans, he tested them by the instruction of some blind pupils. His first pupil was a young blind beggar, named Lesueur, whose widowed mother and helpless brothers and sisters the benevolent Haüy supported, while he taught the boy the elementary studies and music. Lesueur proved a very tractable pupil, and after giving him six months' instruction, Haüy read a paper on the instruction of the blind before the Royal Academy of Science, and exhibited the proficiency of his pupil as proof of the positions he had advanced. The members of the academy declaring their satisfaction at what they had witnessed, appointed a commission to examine the matter more fully. The commission reported in February, 1785, and expressed, in the strongest terms, their admiration alike of the philanthropy of the teacher and the results he had attained. They also commended the new undertaking to the royal favor.

Meantime, the Philanthropic Society offered to support twelve blind children if Haüy would instruct them. He consented, and pupils coming in from other sources, he soon had a class of twenty. It was during this period, also, that he gave to the world his great invention of printing in raised letters for the blind. This seems to have been partly the result of accident. Lesueur being sent to his master's desk one day for some article, and passing his fingers over the papers on the desk, came in contact with the back of a printed note, which had received an unusually strong impression, and distinguished the form of the letter *o*. He brought the note to Haüy to show him that he could do this, and the discovery at once suggested to him that this was the germ of a plan for providing the blind with books. He tested it further by writing upon paper with a sharp point, and reversing the paper, found that Lesueur read it with great facility. To complete his invention, however, it was necessary that the raised characters should be so distinct that the touch of the blind should enable them to distinguish between those which were most similar, and to recognize each letter readily. For this purpose he adopted the *Allyrian* letters, the angular form of which caused them to be most easily recognized.

The five years which followed the favorable report of the commission of the Royal Academy were years of great prosperity to the school for the blind. Patronized and honored by the King and nobles, receiving abundant contributions and benefits from the most eminent artists and musical performers, and constantly praised and applauded, a man of less modesty and dignity of character would have been spoiled by this excessive adulation; but the philanthropist was not one whom flattery could spoil. The notice and contributions of the great were utilized in the carrying out of his purposes for the benefit of his pupils. His types for printing in raised letters were reduced in size and improved in form; he had invented and published a

series of maps in relief; had introduced and brought to some perfection a system of musical instruction; and had established workshops, in which those trades best adapted to the capacities of the blind were taught.

Then came a season of adversity, in which the heroic traits of Haüy's character appeared in strong relief. The Philanthropic Society, his first patron, was broken up at the very commencement of the reign of terror; the school was transferred to the care of the state, and an appropriation for its support voted, but the assignats presently became nearly worthless, and, having exhausted his own fortune, Haüy procured a scanty subsistence for his pupils by printing the numerous bulletins, handbills, and tracts, which abounded at that period. In this work Lesueur assisted him. As the pressure of want grew stronger, Haüy subsisted on one meal a day, lest his dear children, as he called them, should suffer from hunger. For ten years this season of adversity continued, but amid it all he had kept up his instructions in music and in mathematical science, and among his pupils during that dismal period were Gailliod, who subsequently became one of the most celebrated of French musical composers; Peignon, afterwards for thirty years professor of mathematics in the College of Angers; and the poet Avisse, the Kirke White of France. In 1801 some unaccountable impulse prompted the government to consolidate the school for the blind with that great pauper asylum for the adult blind, the Hospice des Quinze-Vingts, at that time the haunt of a large body of dissolute, degraded, and vicious blind beggars. This was more than Haüy could endure. He had cheerfully borne the severest privations with his pupils, but he could not see them exposed to such depraving influences. He protested and petitioned the government to rescind its decree, but finding it inexorable, resigned his position, and the government acknowledged his past services by a pension of about four hundred dollars per annum! He opened soon after a private institution for the blind, in Paris, under the title of *Musée des Aveugles*, but this proving unsuccessful pecuniarily, he accepted, in 1806, the pressing invitation of the Czar, Alexander I, to go to St. Petersburg and found an institution for the blind in that city. On his way he spent some time in Berlin, and assisted Zenne in establishing there the Institute for Blind Youth, which still exists. The institute at St. Petersburg was opened in 1807, and Haüy presided over it with ability for ten years. He had now completed his seventy-second year; the infirmities of age were increasing upon him, and he felt a strong yearning to go back to his native land to die. The Czar had become greatly attached to him, and parted from him with sincere regret, conferring upon him the Order of St. Vladimir, then the highest order of merit in Russia. On his return to Paris he found that the government, having become satisfied of their error, had separated the school for blind youth from the Hospice des Quinze-Vingts, though not without the ruin of many of their most promising pupils. The new director of the school, Dr. Guillié, was not willing, however, to permit him to visit the school, as it was reorganized, and, with the most contemptible jealousy, prohibited the mention of his name in connexion with the instruction of the blind, and in a published history of the school made no reference to Haüy, but attributed its origin to Louis XVI. Under this unmerited cruelty the old man was, as ever, patient and calm, and time soon brought its revenges. Guillié's injustice towards Haüy excited the clamors of the people against him to such an extent, that the government was compelled to order an investigation, which resulted in his disgrace, and the appointment of Dr. Pignier as his successor. The new director lost no time in preparing a suitable ovation as a recognition of the services of the venerable founder of the school, and, on the 21st of August, 1821, a public concert in his honor was given at the Institution of the Blind, and songs and choruses composed for the occasion, and sung by the pupils and teachers, commemorated his trials, sacrifices, and successes; and the aged philanthropist, as he listened, with streaming eyes exclaimed, "Give not the praise to me, my children; it is God who has done all." It was his last visit to the institution. His health soon broke down completely, and after several months of intense suffering he passed away, quietly and peacefully, on the 18th of March, 1822. A monumental tablet in the hall of the Imperial Institute for Blind Youth, on the Boulevard des Invalides, does justice to his memory and sacrifices for the instruction of the blind.

James Gall, principal of the Edinburgh Institution for the Blind, was born about 1784. Mr. Gall commenced, in 1826, a series of experiments with a great variety of alphabets, including all the common and several arbitrary alphabets, with a view of ascertaining what form of letter was best adapted to be read by touch. In 1827 he published his first book in the letter he had fixed upon, a pamphlet of nine pages octavo, in very high relief. This is believed to have been the first book printed for the blind in Great Britain. He was not yet fully satisfied with his alphabet, and continued his experiments to 1832, when he commenced printing books for the blind, and published several portions of the New Testament and some elementary books in it. It is known as Gall's Triangular Alphabet.

In 1837 Mr. Gall further modified his alphabet by giving serrated edges to the letters, which rendered them more legible, and subsequently changed some of them so as to assimilate them more nearly to the Roman letter. The books published in this letter have not come into general use. Mr. Gall has been unwearied in his efforts to call attention to the necessity of giving the blind a good education and of providing a literature for them, and his patient labors in endeavoring to ascertain what would be the form of alphabet best suited to their wants, entitle him to be regarded as one of their most prominent benefactors.

Louis Braille, the inventor of a system of writing with points, or, as it is more generally called, a "dot alphabet," extensively used in institutes for the blind in France and elsewhere on the continent of Europe, as well as in some of the institutions for the blind in the United States, was born in one of the suburbs of Paris in 1809. He was blind from birth, and at the age of ten years was admitted to the Royal Institute for the Blind in Paris, where he soon gave evidence of extraordinary abilities. He attained a very high rank as a musical performer, being distinguished both as an organist and a violinist. In 1829, when but twenty years of age, he modified M. Charles Barbien's system of writing with points so completely as to render it convenient and easy of acquisition; and it was at once introduced into the Royal Institute, where it has been used ever since. The system, as it now stands, is as follows: There are forty-three signs, embracing the entire alphabet, the diphthongs, and

the marks of punctuation. Of these, ten, called the fundamental signs, are the basis of all the rest. These signs, which represent the first ten letters of the alphabet and the ten Arabic numerals, are as follows:

A ○	B ○	C ●●	D ●●	E ○	F ●●	G ●●	H ●●	I ○	J ●●
1	2	3	4	5	6	7	8	9	0

The second series, comprising the next ten letters, is formed by placing one point, or dot, on the left side of each fundamental sign, one line below; the third series, consisting of U, V, X, Y, Z, Ç, (c soft,) È, Á, Ê, Û, is formed by placing two dots under each fundamental sign; the fourth series, embracing Â, Ê, Î, Ô, Ù, Â, Ì, Û, (E, W, are formed by putting one dot under the right hand of the fundamental sign, one line below; three supplementary signs represent Ì, Æ, and Ò. The marks of punctuation are the fundamental signs placed two lines below. For the purposes of musical notation, the last seven of the fundamental signs are used to represent the seven notes, and each of these may be written in seven different octaves by merely prefixing a sign peculiar to each octave. The mode of writing is very simple. The apparatus consists of a board, grooved horizontally and vertically, with lines one-eighth of an inch apart; over this board a frame, like that of the common map delineated, is fitted, with hinges on the side and one or more sheets of paper placed on the board under the frame; a bodkin and a piece of tin, with six holes perforated like these,  complete the apparatus. The writing must be from right

to left, in order that it may be read from left to right. Books are now printed in the dot alphabet by the French and other European institutions. Since 1840 M. Braillé has been a professor in the Imperial Institute for Blind Youth, at Paris.

John Alston, a merchant of Glasgow, and director of the asylum for the blind in that city, was born about 1790. He had been for some years much interested in the instruction of the blind, when, in 1832, the Society for the Encouragement of the Useful Arts in Scotland offered a gold medal, of the value of twenty pounds, for the best form of letter adapted to relief printing for the blind, and appointed Mr. Alston and Mr. William Tayler, of Norwich, referees. Among the numerous alphabets presented was one which had been invented that year by Julius R. Friedland, the superintendent of the Pennsylvania Institution for the Instruction of the Blind, but which was claimed by a Dr. Fry, of London. It was in capitals, nearly like the Roman letter; this form of letter, with some slight modifications made by Mr. Alston, was adopted by the referees, and Mr. Alston, for the next fourteen years, devoted his time, energies, and means to the production of books for the use of the blind. The large size of letter requisite to make this alphabet readily legible by touch, rendered the volumes large and expensive, but Mr. Alston stereotyped and published an edition of the Scriptures in nineteen volumes, and twenty-two miscellaneous volumes, besides maps and cards. Mr. Alston died in 1846, greatly lamented, not only by the blind, but by all who knew him. The form of letter in which his books for the blind were printed is known in England as the Alston or Glasgow letter, and in the United States as the Philadelphia letter. Several books have been published in this letter in England since Mr. Alston's death, and in the United States; the Pennsylvania institution has published nineteen, including a dictionary of the English language in three large volumes.

Henri Hirzel, director of the "Institution for the Blind and Ophthalmic Hospital," at Lausanne, Switzerland, was born in Lausanne about 1810. He has travelled extensively, in order to ascertain what improvements have been made in other countries in the instruction of the blind, and has written several works on the subject, which have a high reputation. His narrative of his instruction of the blind deaf-mute, James Edward Meystre, has excited much attention both in Europe and the United States. Mr. Hirzel has invented an apparatus by which the blind can print, what they wish to communicate in writing to others. It is, he says, inexpensive, and will print thirty-seven letters a minute; but his description of it is not accompanied by a plate, and is not sufficiently definite to be understood without it. Mr. Hirzel's institution is not large, but its reputation, under his efficient management, is not surpassed by that of any institute for the blind, in Europe.

Julius R. Friedland, the first principal of the Pennsylvania Institution for the Instruction of the Blind, was a native of Upper Silesia, born in 1803. He was of Jewish parentage, but was educated at the University of Leipsic, and, while pursuing his studies there, professed christianity. After receiving his degree, he was, for a time, tutor in the family of the Prince of Faustenbergl, and won his entire confidence. At an early period, his attention was called to the condition and privations of the blind, and he finally resolved to devote himself to the work of instructing them. He accordingly qualified himself by a careful study of all the processes in use in the best European schools, and, regarding the United States as an unoccupied field, he came to this country in the autumn of 1832, bringing letters of introduction to Messrs. Robert Walsh and Robert Vaux, of Philadelphia, who had been for some time making an effort for the establishment of a blind institution in that city. He entered at once into their plans, and commenced the institution with a single pupil. His thorough devotion to his work, his zeal, tact, skill, and success, were so marked, that none who witnessed his teaching ever doubted that he had found his true vocation. Mr. Friedland, like Drs. Howe and Russ, early felt the necessity of a better alphabet for printing for the blind, and speedily fixed upon that form known as the Philadelphia or Glasgow letter, of which, in its present form, and as adapted to the use of the blind, he is believed to have been the first inventor. For six years he was spared to witness the rapid growth and increasing interest of the school he had founded, and to win the love of his numerous friends; but a hopeless malady, which attacked him in 1836, finally closed his useful career after two years of suffering. He died March 17, 1839. A lofty shaft in the cemetery at Laurel Hill, inscribed with the name of Friedland, testifies to the grateful remembrance in which his name is held.

Samuel Gridley Howe, M. D., an American physician, and, since 1832, superintendent of the "Perkins Institution and

Massachusetts Asylum for the Blind," in Boston, was born in Boston, November 10, 1801, and having passed through his preliminary studies in the public schools of that city, entered Brown University in his sixteenth year, and graduated there in 1821. He commenced the study of medicine in Boston soon after his graduation, and was desirous of joining the Greeks in their war for independence in 1823, but his father would not consent to his wishes. Having taken his medical degree, and learning, in 1824, that Lord Byron had volunteered in aid of the Greeks, he could not be longer restrained, but embarked on a sailing vessel with small accommodations, and, after a perilous voyage, landed at Monembasia, in Peloponnesus. For the next six years, except a short visit to this country to raise money and supplies for the relief of the Greeks, he devoted himself wholly to the service of Greece, sometimes as a surgeon, sometimes as a guerrilla chief, a volunteer, a superintendent of supplies, the governor, legislator, clerk, constable, commander-in-chief, and physician of a Greek colony, and, anon, as their instructor in the arts of every-day life. In 1830 he left Greece and visited Paris, where he remained the ensuing winter, attending medical lectures. On his return to the United States, in 1831, a project for establishing an institution for the blind in Boston was started by Dr. J. D. Fisher, and Dr. Howe became interested in it, and was soon after chosen superintendent, and sent to Europe to acquire the necessary information and obtain teachers, books, &c. While in Paris he volunteered to carry supplies which had been collected in this country to the suffering Poles, then in insurrection, and having accomplished his humane errand, was arrested just after reaching Berlin, and for six weeks closely imprisoned, but was at last discharged, through the vigorous remonstrances of the American minister, Mr. Rives. On his return to Boston, the "Perkins Institution and Massachusetts Asylum for the Blind" was organized, and Dr. Howe entered with zeal upon his new duties. The first thing to be done, in his view, aside from the ordinary routine of instruction, was to provide books which the blind might read by the touch. The alphabets in use did not please him, and he undertook to invent one which should combine the excellencies and avoid the objectionable features of Haüy's Illyrian alphabet, Pignuer's script, and Gall's triangular one. He laid down two or three principles as fundamental; they were these: the alphabet must be readily legible, hence the letters must have sharp angles, and each be so different in form from any other as not to be mistaken even by the beginner; it must be compact, in order to make the books printed less bulky; the number of characters to be learned must not be too large, and hence it must all be capitals or all small letters; and as the latter would be most compact, they were to be preferred. Acting upon these principles he perfected his alphabet. Dr. Howe achieved a high reputation by his successful training and education of the blind deaf-mute girl, Laura Bridgman, of which he has published an interesting narrative. In common with the principles of other blind institutions in the United States, he has attempted to solve the problem of providing remunerative employment for the blind graduates, without involving the institutions themselves in debt. The experiment has not proved wholly a success, either in his case or in others. The activity and restless energy of the man have not been wholly absorbed in his duties as director of an institution for the blind, and he has founded an asylum for idiotic and feeble-minded youth, of which, for some years, he was acting superintendent; has participated largely in the movement for the relief of Kansas sufferers, and in other measures of public or political interest; and, since the commencement of the war, has been an active and efficient member of the United States Sanitary Commission.

John Denison Russ, M. D., an American physician, who early devoted his time and energies to the improvement of the condition of the blind, and has not ceased from that time to the present to exert himself for their benefit, was born at Essex, Massachusetts, September 1, 1801, graduated at Yale College in 1823, and studied medicine at Boston and New Haven, and subsequently at Paris, London, Edinburgh, and Dublin. In 1826 he returned to the United States, and opened an office in New York city. In 1827 he was appointed almoner of the supplies sent to Greece from Boston, and sailed in June of that year for Greece, with a cargo of provisions. He remained in that country for three years, distributing the supplies forwarded, and for fifteen months superintending a hospital which he had established at Poros. He returned to New York in 1830, and was soon after invited to organize the blind asylum at Boston, but declined, and Dr. Howe was appointed. His attention having been thus called to the condition of the blind, he commenced, on the 15th of March, 1832, the instruction of three blind boys at his own expense, and in the following May added three more to the number. Soon after undertaking this work he was appointed superintendent of the newly chartered institution for the blind of New York. He accepted the appointment, and being desirous to render his pupils capable of self-support, devoted some hours every day, during the succeeding year, to acquiring a practical knowledge of basket-making, mat-making, and carpet-weaving, that he might teach his pupils these handicrafts. The necessity for better forms of raised letters for printing for the blind had impressed him as forcibly as it did Dr. Howe, but his views of what was desirable differed from those of Howe, and he invented a phonetic alphabet of forty-one characters, to which he added twenty-two prefixes, suffixes, &c., and printed some small books for the blind in these characters. The system was ingenious, and the phonetic characters differed so little from the script letters of Haüy in form, that they were read without much difficulty. Dr. Russ also invented a new process of making maps with a raised surface, which, with slight modifications, is still in use. He next simplified the mathematical characters used by the blind, using only four instead of ten. In the midst of these manifold labors his health failed, and he was compelled to resign, and seek abroad its restoration. After his return, while still maintaining an interest in the blind, he engaged in other schemes of philanthropy, aiding in the organization of the New York Prison Association, of which he was, for several years, secretary, serving also gratuitously for five years as its agent for investigating cases of detention. He also exerted himself successfully in bringing about a reform in the penitentiary on Blackwell's island, and the erection of the new workhouse; organized, with the co-operation of his wife and daughter, in 1850, a house of employment for unfortunate poor women, especially those desirous of abandoning a vicious or intemperate life; and, in 1849, was one of the prime movers in the founding of the Juvenile Asylum of New York for the training of vagrant children, and on its organization, in 1851, became its superintendent. In

1858 he resigned his position. During the last five years he has resumed his investigations of the best methods of printing for the blind, and has greatly improved his phonetic alphabet. He has also invented two new dot alphabets, one of two and the other of three lines, which are believed to possess some points of superiority over Braille's, especially in their classification of the letters according to their comparative frequency of use, making those which come oftenest into use consist of the smallest number of dots. He has also succeeded in printing some tracts in the dot characters, on both sides of the paper, with perfect legibility—an improvement which will diminish the cost of printing for the blind.

William Chapin, principal of the Pennsylvania Institution for the Instruction of the Blind, was born in Philadelphia in 1802. The years of his early manhood were devoted to literary pursuits. He was a frequent contributor to various periodicals and newspapers, of two of which he was also editor, and he is the author of several literary works. He removed to New York in 1824, where he was engaged in preparing and publishing a gazetteer and maps of the United States. Removing to Yates county, in the interior of that State, in 1833, he devoted much of his time, while on his farm, to the cause of public education; especially to the improvement of the common schools, of which he was made a commissioner. He extended his investigations to the public school systems of Philadelphia, New York, and Boston, the results of which he spread before the public in lectures and through the press. His visits were subsequently directed to the benevolent institutions of those cities, especially the blind, in which he at once became deeply interested. It was on the occasion of a visit to the New York institution that a letter from the trustees of the Ohio Institution for the Blind was placed in his hands, which led to his appointment as superintendent of that institution in 1840. He at once devoted himself energetically to the work—travelled the State extensively in the vacations, with several of the educated pupils, spreading before the public, to whom the subject was then new, the beneficial results of the system of instruction. This attracted general attention, and the number of pupils was speedily increased from eighteen to seventy-two.

Having visited and examined the various institutions in the United States, in 1845 he made a voyage to Europe, visited all the institutions in Great Britain and Paris, and investigated their systems and improvements. He embodied these in a report to the legislature of Ohio, "on the benevolent institutions of Great Britain and France," which was printed in pamphlet form. In 1846 he deemed it his duty to resign his position in Ohio. He was immediately invited to become a candidate for the situation of principal at Philadelphia, but declined. He then established in Geneva, New York, an institute and normal school, especially designed for the preparation of seeing female teachers, in which he introduced, to a considerable extent, the oral or intellectual system of instruction, pursued so successfully with the blind. After a successful experience of three years in this useful work, he received another invitation from a distinguished manager of the Pennsylvania Institution for the Blind to become a candidate, which he accepted, regarding this as the work to which his life should be devoted. He was elected principal, and entered on his duties in 1849, which situation he still holds.

Under his management, with the intelligent co-operation of a confiding board of managers, that institution has made extraordinary advancement, and stands unsurpassed, perhaps, by any institution for the blind in the world. The development of the musical, literary, and industrial departments, has been most successful. Thousands who attend the weekly exhibitions and examinations are witnesses of this. The work departments, on which so many of the blind must depend for a livelihood, have received most careful attention from Mr. Chapin. Adults are received to learn useful trades, and, in common with others in straitened circumstances, receive, on leaving, an outfit to start them in their business pursuit. Another feature which is peculiar to that institution, and to which Mr. Chapin has given special attention, is the "Home for the Industrious Blind," intended to furnish a home and employment for those blind graduates of the institution who are without near relatives, or who, from other causes, prefer to remain there to labor. This is believed to be the first attempt of the kind in this country, and has worked very satisfactorily. Mr. Chapin's views are directed principally to the education in literature, in music, or in some useful handicraft, of all eligible blind persons in the country, with reference to their self-support and employment, as far as practicable. Their number being limited, the work, he conceives, with some aid from private benevolence, could be effected without difficulty.

Would the narrow limits prescribed to this article permit, it would be desirable to refer to the labors of the Abbé Carton, director of the Asylum for the Blind and the Deaf and Dumb at Bruges, in Belgium, who has won a high reputation as an instructor of the blind, and whose narrative of the instructions of the blind deaf-mute, Anna Temmermans, is fraught with so much interest; to Rev. W. Taylor, LL.D., of England, who has devoted much attention to a system of printing, and other improvements in connexion with the York and Bristol asylums, and to the subject of instructing the blind generally; to Mr. T. M. Lucas, of Bristol, England, the inventor of a stenographic alphabet for the blind, in which numerous books have been printed; to Messrs. J. Hartley Frere, of London, and W. Moon, of the Brighton asylum, both of whom have invented phonetic alphabets for the blind, and have printed, each, twenty or thirty books for their use, in these characters. Some account would also be given of the interesting school of Dr. Ratier, in the arrondissement of Paris, for very young blind children, whom he has instructed in the elementary principles of reading, &c., for the mere pittance of twelve dollars per annum for each pupil. There are also several of the other principals of blind institutions in the United States whose labors deserve notice. Among these, few are more remarkable than Mr. A. W. Penniman, a graduate of the Massachusetts institution, the first teacher in charge of the Ohio institution for three years from its foundation; Walter S. Fortescue, (blind,) first principal and founder of the Georgia Academy for the Blind, now principal and proprietor of a female seminary in Germantown, Pennsylvania, a graduate of the Pennsylvania institution, and of the University of Pennsylvania; Mr. William H. Churchman, now principal of the Indiana Institution for the Blind, himself blind from birth, and a graduate of the Pennsylvania institution, who has, for most of the time since 1844, presided over blind institutions in Tennessee, Wisconsin, and Indiana, and managed

them with an ability not inferior to that of the best superintendents endowed with vision. Dr. Joshua Rhoads, of the Illinois institution, and Dr. Asa D. Lord, of the Ohio institution, also rank among the ablest instructors of the blind in this country.

#### PUBLICATIONS RELATING TO THE BLIND.

The following publications may be consulted with interest: Annual Reports of the Institutions in Europe and America; Address of New England Institution for the Blind, by Dr. S. G. Howe, 1831; three papers to the Society for the Diffusion of Useful Knowledge, Great Britain, by C. Baker, 1842; North American Review, July, 1833: Education of the Blind; Reports of Juries at the Great Exhibition, London, 1851, on Printing for the Blind; Articles on Blind, in Cyclopædia Britannica; Brewster's Edinburgh Encyclopædia; Encyclopædia Americana; Chambers's Encyclopædia; National Cyclopædia; English Cyclopædia; New American Cyclopædia; Report on the Benevolent Institutions of Great Britain and Paris, by W. Chapin, 1846; Edinburgh Review, 1854: "The Blind, their Works and Ways;" British National Review, January, 1861: article, Blind; Letter on the Institutions for the Blind in Europe, by Robley Dunglison, M. D., LL.D., Philadelphia, 1854; National Magazine, New York, 1857: article on the Blind; "A Letter on the Blind, for the use of those who see," by D. Diderot, 1749, translated by Dr. S. G. Howe, Boston, 1857; The Blind of London, by Edmund C. Johnson, 1860; Inquiry into the Musical Instruction of the Blind, by E. C. Johnson, 1855; Tangible Typography, by E. C. Johnson; Causes of Blindness, Ohio Medical and Surgical Journal, by W. Chapin, 1854; The Lost Senses, by John Kitto, D. D.; The Sense Denied and Lost, by Thomas Bull, M. D.; The Land of Silence and the Land of Darkness, by Rev. B. G. Johns, London, 1857; At Work in the Dark, Dickens's Household Words, 1859; Lecture on different modes of Educating the Blind, by the Rev. W. Taylor, F. R. S., England; The Blind, their capabilities and claims, by Alexander Mitchell, (blind,) honorary secretary to the Society for Improving the Social Position of the Blind, London; A Guide to the proper management and education of blind children during their earlier years, (whether in their own family, in public schools, or under private teachers,) London, 1861; *Des aveugles, considérations sur leur état physique, moral et intellectuel*, par P. A. Dufau, Paris; *L'Institut des jeunes aveugles de Paris, son histoire et ses procédés d'en enseignement*, par I. Guadet, Paris, 1850; *Rapport sur l'instruction des aveugles*, par l'Abbé Carton, Bruges, 1837; *Nouveau procédé pour représenter par des points la forme même des lettres*, par Louis Braille; *Notice historique et statistique sur l'hospice royal des Quinze-Vingts*, par Battelle, Paris, 1835; *Annales de l'éducation des sourd-muets et des aveugles*, par l'Abbé Daras, 1853-1856; *Essai sur l'Instruction des aveugles, ou exposé analytique des procédés employés pour les instruire*, par le Docteur Guillie, Paris: second edition, 1819; also an English translation; *Jahresbericht über das Blindenwesen im allgemeinen wie über die Blinden-Anstalten Deutschlands insbesondere*, Berlin, 1854, H. Heintzsch; *Über die Erziehung und den Unterricht der Blinden*, von J. G. Heintzsch, Berlin, 1851; *Anleitung zweck mässigen Behandlung blinder kinder, für deren erste Jugendbildung und Erziehung in ihren Familien, in Öffentlichen Volksschulen, und durch zu ertheilende Privat-Unterweisung*, von J. G. Knie, Breslau, 1851, translated from the fourth edition, with an introduction and appendix, by the Rev. William Taylor, F. R. S., &c., London.

GOVERNMENT PRINTING OFFICE.  
1864.

## PREFACE.

---

THE importance of agriculture as a recourse for wealth, and as supplying the means of subsistence to all classes of community, is so well understood, and its relation to manufactures, so many of the products whereof it consumes, and which it supplies with so many of its most important elements, is so generally appreciated, as to render superfluous any argument to prove its value. It is an interest which, better than any other, may be expected to flourish as manufactures and the arts prosper, and it is of more importance to those interested in its advancement to understand its progress from time to time than to secure any special legislative acts with the view to stimulate its productions. Agriculture will prosper in proportion to the progress of population, and its employment in other productive pursuits. In the early history of all countries prior to the period when manufactures flourish, and the arts are cherished, foreign demand is relied on for the surplus products of the earth, and the ease with which they are supplied enables the producer to incur the cost of their transportation to market to procure certain necessities and luxuries in exchange; but as a country becomes peopled, the relation of the producer to a foreign market insensibly becomes less, until at last it ceases, except upon peculiar emergency, or for articles restricted to climate. With an intelligent people, where land is abundant, the direct application of laws is of but little consequence in invigorating a pursuit which will be prosecuted with greater activity only with the ratio of increased home consumption, as foreign demand, with the exception of that for strictly climatic productions, is too precarious to justify any great expenditure of labor and means solely with a view to exportation; and that country of any great extent which never fails to produce a full supply of the necessities of life for the wants of its own population, will be sure of ability to spare whatever may be necessary to fill any casual extraordinary demand abroad. Many persons are impressed with the belief that it is in the power of the government to promote the interests of the farmer, and that great and direct efforts should be put forth by the state to advance the science of husbandry. In our opinion, however, the surest way in which the power of the government can effectually promote agriculture, is by a steady and consistent policy adapted to encourage the arts and give confidence to the stability of our manufactures; population will then rapidly increase, commerce be promoted, internal improvements multiply, and the power of the state will augment as a natural consequence. Political laws will not modify climate, change the nature of plants, nor fertilize land; they may occasion the distribution of cotton-seeds north and west, but cannot insure the growth of cotton north of thirty-eight degrees, while private enterprise produces 8,000,000 pounds of tobacco in Connecticut, and will produce it wherever the conditions are favorable. The enlightened wisdom of the world, if applied directly to the improvement of agriculture, would not be productive of any sensible increase of crops, while any contingency tending to a greater consumption of the earth's products would be certain to stimulate the efforts of the husbandman, and insure enlarged production. That which renders the pursuit of agriculture honorable and remunerative,

and therefore attractive and popular, is a certain home market; and wherever such exists there prevails a better system of culture, a more refined population, higher energy, a better morality, and in all things a happier condition both for the permanent welfare of the people and good of the state. It is under such circumstances that the merit and adaptation of every new plant deemed useful for food, or in the arts, will not only be cheerfully and intelligently tested, but its value will be made available. Under such circumstances the crops seldom fail, nor do the lands grow poor; the people are not addicted to efforts in short roads to fortune by impositions of marvellous productions at fabulous prices, and it is but seldom they are the victims of such. They never find abundant crops ruinous, nor realize the fertility of their fields only with chagrin. Home demand for many products stimulates variety in cultivation, and increases the capacity of the soil, and as in this country scarcity seldom attends more than one staple production in a season, and then only to a limited extent, the nation is protected from all danger of want or famine so paralyzing to every interest, and so much feared in countries of more dense population, and of smaller area. The state or kingdom, therefore, which pursues a policy best adapted to consume as food, or in manufactures, the products of the soil, confers the greatest possible benefit, not only on that portion of its people engaged in agriculture, but upon all classes of population; and the most enlightened farmers only desire that the general government abstain from all legislation tending to make precarious a sure remunerative demand for its products, and observation proves that those who depend much for direct aid from government are not of that numerous class in our country who by their industry, energy, and success, present noble examples for imitation, and elevate and distinguish the pursuit of husbandry. There is not anything but confidence in certain adequate remuneration that will insure heavy crops of grain and grass, choice breeds of live-stock, produce good fruits, good wine, and develop an improved agricultural literature, and without such inducement we would no sooner expect the farmer to raise supplies of either, if the government should devote all its revenues to the free distribution of seeds and plants, than we would expect the mechanic arts to flourish without a demand for their products, should the government distribute gratuitously the tools of trade; and there rests no more obligation upon the state to legislate specially for the one interest than for the other. By the anomalous policy at present pursued to promote agriculture, the government is sure to incur a large outlay of funds, often resulting in loss of time and disappointment to individuals, and it is an inevitable consequence of failure to equal cherished expectations, to perceive recourse to some novel fallacious expedients to blunt the edge of disappointment, or raise new hopes—at the same time charging iniquity or folly upon former administrators, rather than admit the impracticability of the resort and confess its failure. It was a remark of Buffon, that in “agriculture, as in all other arts, the model which performs best in small, oftentimes will not execute in great;” but our people have been too much tempted by highly colored representations, to build hopes on something new, which, although procured at much outlay, has not so much as been previously tested as to its adaption to our climate or soil by the most limited trial.

That we might advantageously imitate the example of other countries in maintaining public parks and gardens, where all the known useful and ornamental plants of the world should be cultivated under proper direction, coupled with facilities for instruction, no intelligent man will question; but that would be quite different from a system encouraged and practised to the prejudice of that enterprise, which would effectually promote the public interests by supplying everything demanded by the spirit of improvement, both useful and ornamental. One half the amount heretofore fruitlessly expended for the promotion of agriculture could be made to support an institution embracing the practical, orna-

mental, and instructive, which through succeeding time would promote the interests of the agricultural community, improve the tastes, and enlarge the knowledge of all. The useful and ornamental character of trees and plants once illustrated by example, the enterprise of our own farmers, gardeners, and seedsmen will make avail of their advantages, as those interested in the mechanic arts do from useful mechanical inventions, and do so at their own charge. With such an organization a serial publication might be advantageously connected, to give the results of its experience, and make record of the current inventions and improvements in agricultural implements and machinery, at home and abroad, which should be conducted with sufficient ability to command respect, and integrity to inspire confidence in its representations. It may appear very easy to pursue a practice involving in its administration no demand for enlarged views, or scientific attainments, but time will demonstrate that the utility of such a procedure will not be found commensurate with its expense. If any differ from us in these opinions, we are inclined to believe they realize but little of the disappointed hopes and misapplied labor of thousands, and form their conclusions from results which should naturally follow the vast expenditures so lavishly made by our government in behalf of agriculture, and the cheering promises which have induced them, rather than from clearly ascertained beneficial results in any degree comparable with their cost. It is obligatory upon the state, and beneficial to all, to present periodical exhibits of our various productions, because this can only be done by the state, and this is especially necessary in a country where there exists such a boundless expanse of unoccupied territory adapted to agriculture, mining, and manufactures, which may be made available in increasing our power and wealth as rapidly as may be consistent with healthy progress. When we shall have more nearly attained to the conditions of some older nations, where production and consumption are so nicely balanced that the slightest failure in any one staple crop would endanger the security and happiness of the people, or stability of the state, the direct active co-operation of the government with the people may become judicious; but happily for us, such a contingency is far distant, as, apart from the general spirit of inquiry and enterprise of our people, it will be long before population becomes redundant, and the conditions of our climate are such that what may produce failure in one crop promotes the growth of others.

With us but few of the prejudices have to be overcome which in older countries attach to the use of improved agricultural implements, and to a system of culture obsolete where intelligence prevails. Here we have no dull, lethargic confidence in the perfection of anything connected with agriculture, because we cannot move without realizing the rapid, ever-varying improvement, such as must convince even a man blind from his youth that nearly all the operations of the farm are conducted in a manner different from what they were formerly.

It has become the wise policy of the general government to take a periodical account of the productions of agriculture, as well for the instruction of the people as for the information of the state, and it is upon this "account" that all estimates of the productions of subsequent years are based, so that really all we know of our annual productions from one decade to another, is deduced from the decennial returns of the census. While such investigations are not of recent origin, it is believed that we have entered into more general details than have other nations, of whom comparatively few have found it practicable to obtain the results, while lamenting their want. The object of the present volume is to represent the agricultural productions of our country for the year ending on the 1st of June, 1860, and the live stock on the day mentioned. In presenting these results, we shall at the same time represent the growth and progress of some interests, and the proper method of culture as to others, in the

hope of being able to render the volume more useful and instructive to the agricultural community, and interesting to the general reader. It is our intention to be historical and practical, rather than theoretical, and while those partial to startling and visionary suggestions may deem the commentary wanting in interest, the intelligent farmer will, we trust, acquire instruction from the perusal of the text, as well as derive advantage in the study of the figures. To be enabled to perform our duty more acceptably, we have availed ourselves of the opinions and agricultural experience of others, whose opinions have been verified by the success with which their professions have been attended. Our thanks are due to B. P. Johnson, of Albany, for counsel cheerfully accorded when a sense of incompetence created doubts of our correctness; to Joseph Harris, of Rochester, New York, and to Edward D. Mansfield, of Ohio, for much general information on the subject of agriculture and the effects of internal improvements; and to J. F. Ballantyne, of Chicago, for information relative to that prodigious interest of the country, the grain trade. For the article on the vine and wine-making, we are indebted to Robert Buchanan, of Cincinnati, Ohio, a gentleman not more distinguished for his successful cultivation of the grape than for his investigating mind and general attainments. To William Renick, of Pickaway county, in the same State, we are under obligations for the facts connected with the past history of the cattle trade of the west with the east, and the driving system, formerly of such vast importance to the intermediate regions, but which will soon be forgotten, the railways now supplying a more easy and profitable means of transfer. As our country confers no honors for distinguished services in the peaceful walks of life, as well for history as from a sense of justice, we make frequent allusions to individuals in the body of these volumes, and take pleasure in associating with their beneficent works the names of men who have proved useful to the country, as a duty to them, and an incentive to others. Charlatans enjoy and outlive their honors, while the reputation of real benefactors continues a rich inheritance for their children. Regretting our inability to present a more complete commentary on the figures, we believe the volume will prove useful as a statistical compilation, and more generally interesting to the agriculturist than have any of its predecessors. The duties of the Census Bureau involve so wide a range of practical and scientific inquiry as to preclude claim to anything approximating perfection in the illustration of its multifarious details, and we only ask the concession of having performed a laborious duty with an earnest intent to develop impartially the material interests of the country.

# INTRODUCTION.

## AGRICULTURE IN THE UNITED STATES.

By the foregoing table it will be perceived that, in 1860, the agricultural area of the country embraced 163,110,720 acres of IMPROVED LAND, and 244,101,818 acres of Land Unimproved. In other words, for every two acres of improved land there are three acres of land connected therewith not yet under cultivation; while the gross aggregate of uncultivated territory, fertile and waste, swells to 1,466,969,862 acres.

This fact gives color to the agriculture of the country. Land is abundant and cheap, while labor is scarce and dear. Even in the older-settled States there is much land that can be purchased at extremely low rates; and, by a recent act of Congress known as the Free Homestead law, every citizen of the United States, or any foreigner who shall declare his intention of becoming a citizen, can have a farm of 160 acres without charge. As good land as any in the world is offered to actual settlers on these easy terms.

Under such circumstances it is evident that the *intensive* system of agriculture which is practiced in some older and more densely populated countries, where labor is abundant and the land mostly under cultivation, cannot, as a general rule, be profitably adopted at present in this country. It has been said that American agriculture is half a century behind that of Great Britain. In one sense this is, perhaps, true. Our land is not as thoroughly under-drained, manured, and cultivated as that of England, Scotland, or Belgium; but we can, and do now, produce a bushel of wheat at much less cost than the most scientific farmer of England can by the best approved method of cultivation, *even if he paid nothing for the use of his land.*

We do not contend for a superficial system of agriculture. All that we ask is, that those who censure our farmers for not cultivating and enriching their land more thoroughly, should take into consideration the circumstances which have surrounded us. High farming involves high prices. The system of cultivation and manuring which is profitable in Great Britain would not be remunerative in the State of New York, because labor is higher and produce lower; and the system which is profitable in New York might not be advantageous in Iowa. An artificial manure that could be profitably used on wheat which brings \$2 per bushel, might prove a very unprofitable application where wheat is worth only \$1 50 or \$1 per bushel. In the State of New York, where land is comparatively high and prices good, there are many instances where \$20 to \$30 per acre have been expended in under-draining, with great profit. But it does not follow that the same expenditure would be advisable in a section where the best of land can be purchased in fee simple for \$10 per acre. The same is true of all other improved processes of agriculture. Their adoption is simply a question of profit and loss. Where land is cheap and rich, it will not pay to expend much labor and money in making or in purchasing manure.

But, it may be asked, "Will not the practice of raising crops without manure impoverish the land?" Certainly it will; but our hardy pioneers, having enjoyed the cream of the soil as a reward of their enterprise, go into a yet newer country, cut down the original forests, clear up the land, and raise all the grain they can. The money thus obtained is expended in the construction of roads, houses, barns, schoolhouses, churches, and colleges. Smiling villages and populous cities spring up, and in a few years the comforts, convenience, and even luxury of civilization are enjoyed—all the result of wealth which has been dug from the soil. Admitting that after all this is effected, the land is not so rich as when first cleared, and that more labor has to be expended in its cultivation, nevertheless much good has been accomplished. The fact is, this question of impoverishing the soil is not clearly understood. Much has been written on this subject, both in Europe and America; and a leading English agricultural journal, the *Mark Lane Express*, says: "It has long been our opinion that the grain-exporting power of the United States was likely rather to diminish than to increase under the

ordinary circumstances of the country. This opinion was derived from the statistical notices of the census and of the Patent Office, and confirmed by the statements of Jay, Wells, and other American writers on the subject. These authorities have warned the agriculturists that if an alteration did not take place in the mode of cultivation, the United States would, in a few years, require a large importation of wheat, instead of being able to export to Europe."

This was written in 1861. Since then we have *exported more grain to Europe than during any former period*. The reason assigned for the opinion thus expressed, that the United States would soon become a wheat-importing instead of a wheat-exporting country, is "the scourging and exhaustive system of husbandry now practiced." There is *some* truth in these remarks. Our system of cultivation has been, and is now to some extent, a scourging and an exhaustive one. *It takes more from the soil than it returns*; and the time will come, as it already has in some sections, when wheat cannot be as easily or as cheaply raised as it was when the country was new. But it does not at all follow from this that the United States will cease to grow all the wheat it requires. We will have to manure our land and cultivate it better; but this is nothing more than has been experienced in other countries. We shall farm better as soon as such improvement is perceived to be profitable and necessary.

But what are we to understand by an "exhausted soil?" No phrase is more common in agricultural literature, and none more vague and indefinite. JOHN BENNETT LAWES, than whom there is no higher authority, speaking of his field on which his celebrated wheat experiments were made, says, it was purposely "*exhausted*" before the commencement of the experiments, and in another of his able papers in the *Journal of the Royal Agricultural Society*, he says: "All the experimental fields were selected when they were in a state of agricultural exhaustion." And he tells us what he understands by the term. He says: "The wheat-field after having been manured in the usual way for turnips at the commencement of the previous rotation, had then grown barley, peas, wheat, and oats, without any further manuring, so that when taken for experiment in 1844, it was, as a grain-producer, considerably more exhausted than would ordinarily be the case."

Here we have the highest English agricultural authority speaking of land as "exhausted" after having grown four crops without manure, the previous crop having been manured; and if this is all that is meant by exhaustion of the soil, we must admit that much of the cultivated land in the older parts of the United States has been exhausted. But one plat in Mr. Lawes's wheat-field has produced a crop of wheat *every year* since 1844, averaging about fifteen bushels per acre, and this without one particle of manure. It is clear, therefore, that the land itself was not exhausted, and in speaking of this as an agriculturally exhausted soil, Mr. Lawes simply intended to say that the *manure* which had previously been used was exhausted.

In this sense our farmers are rapidly exhausting their soil. The English farmer manures his land, grows three or four grain crops, and then considers his land exhausted. The American farmer cuts down the forest, burns more or less of the timber on the land, and scatters the ashes on the surface, then turns up the soil as best he may among the stumps, sows his grain and gets good crops. Why? Because the land has *been heavily manured by nature*. The trees and underwood have through their deep roots been drawing up mineral matter from the earth, and the leaves absorb carbonic acid and ammonia from the atmosphere.

Shall he avail himself of this manure, or shall he let it lie dormant? What would be said of the farmer who should give his land a heavy coat of manure and then neglect to raise crops? If it will produce good wheat and other cereals that command the ready cash, is he to be accused of adopting a "scourging and exhaustive system of agriculture" for growing these crops? And yet this is what the American farmer has done. His land was rich, but he was poor and raised those crops which afforded the most immediate profit. We would not be understood as advocating the continued growth of grain crops without manure; our only object is to show the erroneous conclusions to which a misuse of statistical facts may lead, and to vindicate the American farmers from the charge so frequently preferred against them, of recklessly exhausting their soil. We think they have simply exhausted the manure which nature has spread upon their recently cleared fields, and that in doing so to a prudent degree, they were not unwise.

## AGRICULTURAL IMPLEMENTS.

PROBABLY no exhibition of our national statistics is more important or satisfactory, than the foregoing tables showing the great increase and present extent of the construction and employment of agricultural implements and machinery.

The high price of labor has stimulated mechanical invention. In no other country are there so many cheap and efficient implements and machines for facilitating the labors of the farm. In older and richer countries we find more expensive machinery, but, as a general rule, it is too complicated and cumbersome for our use. We have been thrown on our own resources, and have no reason to regret it.

Whatever augments the productive capacities of the soil, or increases the profits of labor and capital employed on so large a scale, either in the first production or the subsequent handling of crops, becomes a practical element in the general prosperity. The vast power resident in machinery, even the more simple applications of the mechanical powers, with their modern perfection of detail, gives this creative force, which may be increased almost beyond computation by the use of steam as a prime mover. Thus, every machine or tool which enables one farm-hand to do the work of two, cheapens the product of his labor to every consumer, and relieves one in every two of the population from the duty of providing subsistence, enabling him to engage in other pursuits, either laborious, literary, professional or scientific, practically duplicating at the same time the active capital or the purchasing power of the producer, thus enhancing the comfort of all and stimulating the common enterprise.

When the utility of labor-saving appliances in agriculture shall come to be fully apprehended, and made generally available in the clearing, draining, and tilling of the soil; in the planting, irrigating, cultivating and harvesting of crops, and in their speedy preparation for market, we may regard the occurrence of famine, either from deficiency of labor, as in time of war, or from the contingencies of soil and climate, as practically impossible. Already has the use of improved implements, aided by scientific and practical knowledge in all the processes of the farm, resulted—like the use of machinery in other departments of industry—in such a diversification and increase of the forms of labor, and such a cheapening of its products under ordinary circumstances, that we rarely hear of the unreasoning and jealous violence of farm laborers, who in England, a generation since, wantonly destroyed all the agricultural machinery of a neighborhood, even to the common drills, in the mistaken opinion that its

use was an infringement of their rights to labor. Its palpable advantages has disarmed the traditional prejudice of the husbandman himself, who is fast becoming as progressive as his neighbor. It has lifted much of the drudgery from the shoulders of the country-bred youth, who no longer loses his elastic step and suppleness of limb in the moil of the farm, which he once instinctively shunned as degrading, while he sought the lighter and more or less intellectual pursuits of the city. It has thus tended to elevate the pursuit of agriculture to its proper position in the social scale, as one of dignity and independence, and not one of mere physical toil, to be shared in common with the brute.

It is in the United States especially, where vast areas of improvable and fertile lands invite the labor of a sparse population, that agricultural machinery is capable of effecting its greatest triumphs. Far back in our colonial days the stream of emigration bore the young and adventurous of the Atlantic settlements toward the richer bottoms and prairies of the west. A gradual deterioration of the fertility of the soil of the older States from constant cropping, and the consequent increased labor required with the imperfect implements formerly in use, were sufficient to maintain the yearly exodus. Columns of hardy laborers from Europe have annually sought our shores, and for the most part have as promptly filed off in the same direction in quest of cheap farms, or in the more alluring search for the precious metals. As a consequence, civilization smiles upon the shores of either ocean, and looks down from the mountain summits which separate them. A prosperous and expanding agriculture, with most of the arts which it demands and fosters, has been rapidly extended over a territory of enormous breadth and fertility, which lacks only the labor of adequate cultivation to develop its vast resources in a wealth of cereal production as yet scarcely imagined. The very causes, however, which have opened up this territory to agriculture and the arts have produced and maintained a continued scarcity of labor, and kept its wages at a permanently high price. It is this enormous area of farm lands, and this great dearth of manual labor throughout the Union, that our inventors and mechanics have from an early period been invited to supply with labor-saving contrivances.

Fortunately the people of this country have not been slow to adopt the most efficient substitutes for animal power, and the inventive talent of the nation has found an ample and remunerating field for its exercise in originating and perfecting instruments adapted to all the wants of the farmer and planter. The great staple products of cotton, grain, and hay, have especially demanded the substitution of mechanical for muscular labor; and some of the happiest products of American skill have been the result.

Scarcely less valuable in the aggregate, however, are the numerous minor inventions whereby the labors of the farm and the household have been saved. Implements of this kind make up a large portion of the stock in trade of the makers and venders of agricultural wares. This successful application of the mechanics of agriculture has happily supplemented the rapid displacement of a large amount of rural labor called off by the war, manufactures, and the mines, and has itself in turn been stimulated by the high prices of produce consequent upon increased demand both for home and foreign consumption.

Evidence that this scarcity of labor in the United States has been a principal incitement to the invention and manufacture of agricultural implements is found in a late report of the Commissioner of Patents, who states that "the most striking fact connected with this class is the rapid increase of applications filed. Notwithstanding half a million of our agriculturists have been withdrawn from the farm to engage in military service, still the number of applications for patents on agricultural implements, (exclusive of reapers, bee-hives, horse hay-forks, and horse hay-rakes,) has increased from three hundred and fifty in 1861, to five hundred and two in 1863."\* The number of patented inventions belonging to the class of agriculture, previous to 1848, was 2,048, since which time the number has been vastly augmented. In the United States, as in Europe, the principal improvements in agricultural and horticultural implements have been made within the present century. As a branch of manufacture, this class of machinery has been wonderfully extended within the last ten or fifteen

\*Introductory report of Commissioner of Patents for 1863, page 21.

years, having received a great impetus from the exhibition in London in 1851—where our own progress in this respect created so much surprise among foreigners—and the several international fairs which have taken place since that time. Throughout Europe and America, until a comparatively recent date, the implements of the farm remained extremely rude, primitive, and inefficient in form. Attention appears to have been first strongly awakened to the value of mechanical aids in farming about the period of the first introduction of agricultural societies.

The Royal Society, established in England in 1660, encouraged improvements in agriculture. But in the transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce, instituted in London in 1753, we trace a still more liberal promotion, and a general interest in agricultural progress. These societies prepared the way for the establishment of purely agricultural associations. The first associated effort made in England to encourage agriculture by specific rewards was in the premiums annually offered by the Society of Arts after the year 1758, for experiments in husbandry, and for improved implements of the farm. The first agricultural society in Great Britain, the Society of Improvers in Scotland, established in 1723, encouraged improvements in tillage, and in farm implements, with such effect that "more corn was grown yearly where corn never grew before than a sixth of all that the kingdom used to produce at any previous time."\* About the same time Jethro Tull introduced—along with his system of deep tillage and thorough pulverization of the soil—the use of the horse-hoe, the drill, and other improved utensils, and became the greatest practical improver of agriculture in the last century. He even attempted an automatic threshing-machine, and incurred the usual charge of being a visionary innovator. The profit of drill husbandry was also demonstrated by John Wynn Baker, of Kildare, in Ireland, who in 1766 commenced a series of experiments with a view of systematizing agricultural knowledge by establishing fixed principles of rural economy, and showed by actual experiment that the saving effected by the drill and horse-hoe amounted in fifteen years to the fee-simple of all the tillage lands of the kingdom. He established as a part of his project a manufactory of farm implements, and issued a catalogue of seventy different machines and tools, all new to the agriculturist at that time. Agricultural machines were thenceforth made with more regard to scientific principles.

The earliest agricultural associations in the United States were established in 1785, in South Carolina and Pennsylvania. In the first-mentioned State, indeed, nearly a century before, the assembly passed "an act for the better encouragement of the making of engines for the propagating the staples of the colony," which was followed by legislative encouragement to various individuals who improved the machines for pounding and cleaning rice. In 1784 the assembly enacted a regular patent and copyright law, giving to the authors of books and the inventors of useful machinery the exclusive benefit of their productions for fourteen years. The Philadelphia Society for Promoting Agriculture, established in March, 1785, and after a period of inaction revived and incorporated in 1809, through the exertions of the Hon. Richard Peters, awakened much attention to the subject of improved implements and machinery, by means of a judicious system of premiums, and of practical essays. In July, 1809, Mr. Peters proposed to the society "a plan for establishing a manufactory of agricultural instruments, and a warehouse and repository for receiving and vending them." In that paper he states that no manufactory of agricultural implements in general existed in the United States, although the demand was prodigiously great. The proposed manufactory was to produce, under the patronage of the society, every implement of husbandry, both common and extraordinary, in use at home or abroad, if approved on trial; none to be sold without inspection and the stamp of the society's agent. His plan also embraced a collection of models in the manner of the Conservatory of Arts and Trades, established at Paris a few years before. The Massachusetts Society for Promoting Agriculture, incorporated in 1792, labored successfully to promote like improvements. The first statistics of the national industry collected in the following year embraced one small manufactory of hand-rakes, in Berkshire county, Massachusetts, which made annually 1,100 rakes, valued at \$1,870. The census of 1820 gave very

meagre information respecting this branch of production. Several small manufactories of ploughs, scythes, axes, shovels, hoes, &c., existed in different States, and one of patent steel pitchforks, in New Haven, Connecticut, turned out about \$5,000 worth annually. During the next thirty years the business increased more rapidly, the traditional prejudices of farmers gradually giving way before the established utility of labor-saving appliances in the cultivation of the vast domain of our national agriculture. The form and finish of ordinary farm tools were much improved, and a few grand inventions were brought forward. In 1833 rice was successfully threshed out in the southern States by animal and steam power. The harvesting of grain by machinery, which had been several times essayed at an earlier period, was the same year attempted at Cincinnati, where the late Obed Hussey cradled wheat as fast as eight persons could bind it.

State and county agricultural societies were, during the same time, organized in nearly every section of the Union where they did not already exist. The system of annual fairs and exhibitions of farm products and machinery instituted by them, and encouraged by public awards of premiums, powerfully stimulated invention, and made our farmers familiar with the best forms of agricultural implements in use at home or abroad. Of like influence, but wider scope, was the American Institute in New York, which has made its influence felt in every department of industry.

The exhibition of the industry of all nations held in London in the year 1851 exerted a vast influence upon the progress of ideas on the subject of mechanical agriculture, as it did upon all other branches of art. The contrasts there presented between the highest results of modern skill and ingenuity exercised upon the implements of husbandry, and the rude models of the plough and other tools to be seen in the Indian department, little improved since the days of the Hebrew prophets, forcibly illustrated the agency of the mechanic and the engineer in the art of subduing nature to the will and service of mankind.

Although the number of implements of each kind exhibited by the United States on that occasion was small, the variety shown was considerable. The general excellence of American ploughs, reapers, churns, scythes, axes, forks and other implements, was acknowledged by the public admission of disinterested judges from all parts of the world, and the particular merits of many by the medals awarded, and by the number of orders received at the time by the manufacturers. The triumph of the American reapers marked a new era in agriculture, and gave a strong impulse to the inventive genius of Europe and America. The emulation awakened among manufacturers by the London exhibition was still further stimulated by the Crystal Palace exhibition, which took place in New York in 1853-'4, when more than one hundred American manufacturers competed for honorable distinction in this department of mechanics.

The influence of these exhibitions of the collective ingenuity of the world upon our own countrymen, in furnishing our mechanics with a standard of comparison by which to measure their own contributions to the world's progress with the most improved implements of the civilized world, and our agriculturists—already familiar with American instruments through our State and local fairs—with a view of the appliances of agriculture in other lands, can scarcely be overrated.

Some of the results are to be seen in the tables before us.

Credit is also due to the United States Agricultural Society for instituting a great national field trial of reapers, mowers, and other implements, held at Syracuse, New York, in 1857, for the purpose of testing practically the relative merits of different machines and rewarding special excellence.

The magnitude of the interests involved in the successful production of a new labor-saving implement for husbandry should alone prove a sufficient spur to inventors and manufacturers. A slight improvement in straw-cutters has enabled its inventor in a western tour of eight months with a model to realize forty thousand dollars. Another has been known to sell a machine to thresh and clean grain, after fifteen months use, for sixty thousand dollars. The McCormick reaper is believed to have yielded its inventor annually a princely income. A single manufacturer has paid the legal representatives of a

patentee \$117,000 in a single year for the use of a patent-right on an agricultural machine which others were making at the same time by contract with the owner.

From an article upon agricultural implements, published in the annual report of the Department of Agriculture, by the Hon. M. L. Dunlap, of Illinois, we are pleased to see that invention in this branch has not been stationary during the war. Among the principal competitors for public favor in prairie farming, to which his remarks chiefly relate, are the rotary spader with horse-power, which promises to be more effective than the steam-plough with traction engines, the latter having thus far proved a failure in moist or cultivated soils; the steel-clipper plough, with polished cast-steel mold-board; the two-horse cultivator or plough; the iron roller; the hand sowing-machine; reaping and mowing-machines, separate or uncombined; the sulky, wire-tooth horse hay-rake; the horse hay-fork or patent pitchfork; the horse-power thresher with straw-carrier and bagging apparatus attached; the drain-plough; the portable farm mill and the sorghum mill. But the statistics of the eighth census will measure the public appreciation of these and other new productions of American skill, and their influence upon the rural economy of the nation.

The cash value of farms under actual cultivation in the United States in 1850 was \$3,271,575,426. Their value had risen in 1860 to \$6,645,045,007, an increase of 103 per cent. in ten years. The amount of capital invested in implements and machinery for their cultivation in 1860 was \$246,118,141, having in ten years increased \$94,530,503, or more than sixty-three per cent. Thus, the fixed capital of the agriculturists in farms, and in farm tools and machinery, both increased in a ratio much more accelerated than that of the population, which during the same time augmented at the rate of only thirty-five and one half per centum. If we suppose the rural population to have increased in the same proportion with the whole, and the productiveness of the soil to have remained unchanged, we shall perceive that an immense increment of productive force accrued to the nation within ten years in the mechanical appliances of agriculture alone. Taking the aggregate number of acres of improved lands in the United States to be, in round numbers, one hundred and sixty-three millions, as shown by the returns, it would thus appear that the average value of farm implements and machinery for each farm of one hundred acres is only about \$150, which is probably less than one third the sum that could be so invested with profit, at least in the older settled States. The greatest deficiency in this respect is found in New England, where it is only \$1 34 per acre, probably due to the ruggedness of the country. In the middle States the value of machinery employed is \$2 07 per acre; in the western States \$1 56, and in the southern \$1 48 per acre. Notwithstanding the evidence, therefore, of an improvement in the quantity and quality of implements, and inferentially of a better system of farming, there is manifestly room for further improvements in this respect, and ample encouragement to our agricultural machinists to supply the growing demand.

The production of labor-saving machinery, as will be shown by the tables of manufactures, was still going on to the amount of \$17,487,960 in 1860, which was likewise an increase of nearly 156 per cent. over the value made in 1850, when it reached the sum of \$3,812,611. This was exclusive of all articles made on the farm, which was formerly considerable, but is yearly decreasing as regular manufactories and depots for the sale of farm implements are multiplied, and their cost diminished. It also excludes cotton-gins, scythes, hoes, shovels, spades, forks, and some other articles of hardware, wagons, carts, and wheelbarrows, the value of which amounted to \$11,796,941, and might appropriately be added to the above table.

Of the total product in 1860, nearly two millions in value was made in New England, being an increase of about sixteen per cent. upon the returns of 1850.

The middle States increased their production from less than two and a quarter to upward of five and three-quarter millions, or 134.2 per cent. The great States of New York and Pennsylvania returned, the one 333, and the other 260 establishments devoted to this branch of manufacture, and the increase in their product was 172.7 and 85.5 per cent., respectively, over the business of 1850.

In the western States the increase was most extraordinary, the value having augmented from \$1,923,927 to \$3,707,194, or 352.5 per cent. Their total production was nearly one-half that of the whole Union. Its increase alone was nearly thirty-nine per cent. of the whole, and nearly equalled the total manufacture of the United States in 1850. The States of Ohio and Illinois, together, manufactured to a greater amount than any other two States in the Union, the value amounting in the former to \$2,820,626, and in the latter to \$2,379,362, and the increase to 405.5 and 212.2 per cent., respectively. Iowa increased its manufacture 1,208.6 and Kentucky 755.4 per cent. over the product of 1850.

In the southern States the aggregate was but little over one million, and the rate of increase nearly thirty per cent. Virginia was the largest manufacturer, but in several there was a falling off from the product of 1850, after excluding cotton-gins, &c., as before mentioned.

The largest amount manufactured in any one county in 1860 was in Stark county, Ohio, in which fifteen establishments produced \$900,480, the larger part of which consisted of mowers and reapers, and of threshing-machines and separators, in each of which three factories were employed. The next largest county production in this branch was in Cook county, Illinois, which made to the value of \$529,000, chiefly in the city of Chicago. Of that sum, \$414,000 was the value of 4,131 reapers and mowers made by a single establishment, the largest in the country. Rensselaer and Cayuga counties in New York, each produced upward of \$400,000 worth of agricultural implements, and a single firm in Canton, Stark county, Ohio, made reapers, mowers, and threshers to the value of \$399,000.

From the New England States there is a considerable exportation of agricultural implements to the British provinces, the southern States, and other parts of the world.

That the large rates of increase in this branch indicated by the foregoing figures are not due simply to the increase of population, is shown by the fact that in Illinois, whose rate of increase with so large a population is without a parallel, the increase in value of agricultural implements manufactured in 1860, as compared with 1850, was 212 per cent., while the increase of population during the same period was only 101 per cent. In Ohio the population increased only 18.14 per cent., while its production of agricultural implements was augmented 417.6 per cent.

We subjoin a summary of the progress of invention in relation to a few of the more important instruments of this class, having given in the preliminary report an account of the progress in threshing implements.

**THE PLOUGH.**—Could the history of this machine, the type and pioneer of all other implements of husbandry, be traced from its origin, it would probably be found that few agricultural utensils have undergone greater modifications, or been more slowly improved than the plough. Originally, nothing more than the rude branch of a tree, with its cleft and curved end sharpened to scratch a furrow for the seed, possibly, as suggested by the ingenious Tull, in imitation of the tillage effected by swine, the instrument appears at this time to have been brought as nearly to perfection as it is possible to attain. The primitive plough, a "mere wedge with a short beam and crooked handle," became in time fitted with a movable share of wood, stone, copper, or iron, wrought to suitable shape, as we find it in the hands of our Saxon ancestors. To this a rude wooden mould-board to turn the furrow was afterward added, and with various improvements in shape, continued in use until near the present time.

What was its form or efficiency in the days when Elisha was summoned from ploughing with twelve yoke of oxen, to assume the mantle and functions of the Hebrew prophet, may not be quite apparent, but the plough was certainly hundreds of years in reaching the imperfect state above described, and was several hundred more in approximating its present improved condition. In the middle of the last century the ploughs of southern Europe had been little improved, and were still destitute of a coulter, as in the old Roman plough of the days of Virgil and Columella. It has received few modifications there down to this time. Even in England, at that period, the plough was an exceedingly rude and cumbersome affair compared with the best now in use. It was no uncommon thing in parts of the island, thirty years ago to see from three to five horses in light soils, and in heavy ones sometimes, as many as seven attached to a plough, which turned about three-quarters of an acre per diem. The old

Scotch plough was still worse, and in Scotland, where agricultural machinery is now most perfect, no instance was known of ploughing with less than four horses. The usual number was six horses, or four horses and two oxen, and sometimes as many as ten or twelve were yoked to it, each requiring a driver. William Dawson, soon after 1760, introduced the custom of ploughing with two horses abreast with lines.\*

Although the swing-plough is believed to have been the earliest used in Great Britain, one and two wheel ploughs—long used on the continent—were most in favor. Turn-wrest ploughs, drill, drain, and trenching ploughs, and others adapted to different uses, were employed in considerable variety.

A capital improvement in the plough was the invention of the iron mould-board and landside. An approach to this was made by Joseph Foljambre, of Rotherham, England, who in 1720 took out the first patent of the kind recorded. It was for a mould-board and landside of wood sheathed with iron plates, the share and coulter being made of wrought iron with steel edges. One of these patent or Rotherham ploughs—as all similar ones were called for many years—was imported and used for some time with much satisfaction by General Washington, but, becoming worn, our ploughwrights were unable to repair it. The ploughs used in New England early in this century, and more recently in the south, were of similar construction. About the year 1740 James Small, of Berwickshire, in Scotland, first introduced the cast-iron mould-board, still using wrought-iron shares. During fifty years he continued to manufacture and improve the Scotch swing-plough, which, since made wholly of iron, has long been regarded as the best in use in England. In 1785 Robert Ransome, of Ipswich, introduced cast-iron shares, and about 1803 made improvements still in use, by making the cutting edges of chilled iron harder than steel, by casting them in moulds upon bars of cold iron. The making of the first iron plough has been attributed to William Allan, a farmer of Lanarkshire, in Scotland, in 1804, but an iron plough was presented to the Society of Arts in London as early as 1773, by a Mr. Brand. The cast-iron plough was introduced soon after. Like most other improvements in rustic machinery, the iron ploughs, though doing much superior work at less than half the expense of the clumsy wooden plough of that date, came tardily into use. It is said that Sir Robert Peel, in 1835, having presented a farmers' club with two iron ploughs of the best construction, found on his next visit the old ploughs with wooden mould-boards again at work; "Sir," said a member, "we tried the iron, and be all of one mind, *that they made the weeds grow.*"† A similar prejudice opposed the introduction of the first cast-iron plough in America, patented in 1797 by Charles Newbold, of New Jersey, who, after spending, as he alleges, \$30,000 in trying to get it into use, abandoned the attempt, the farmers declaring that iron ploughs poisoned the soil and prevented the growth of crops.

The plough has received many improvements at the hands of Americans, and has become an article of frequent exportation, while even in Great Britain the ploughs now used are generally made after American models. The year 1617 is mentioned by an early annalist as the "remarkable period of the first introduction of the labor of the plough" in Virginia. In 1625 we find the Dutch colony on the Hudson supplied with "all sorts of seeds, ploughs, and agricultural implements," to which in 1662 was added a first-class wheel-plough, with its pulleys, &c., at a cost of sixty florins. In 1637 the colony of Massachusetts contained but thirty ploughs, and Connecticut probably less than one-third the number. Nevertheless, the same year a resident of Salem was promised an addition of twenty acres to his original grant if he would "set up ploughing." We involuntarily think of the steam-plough when we read that another citizen of that town in the following year was allowed more land because he had "not sufficient ground to maintain a plough" on his farm of 300 acres. Owing to the scarcity of mechanical labor, most of the ploughs and other farm utensils were for a long time made on the farm, with the aid of the nearest smith. The casting of plough-irons was done at nearly every small foundry. Their make was, of course, clumsy and inefficient. Among the kinds still remembered by many was the Cary plough, with clumsy wrought-iron share, wooden landside and standard, and wooden mould-board

\* McCulloch's Statistics of British Empire.

† Philips' History of Progress in Great Britain.

plated over with sheet-iron or tin, and with short upright handles, requiring a strong man to guide it. The bar-share plough was another form still remembered by many for its rudely fitted wooden mould-board and coulter, and immense friction from the rough iron bar which formed the landside. The Bull-plough was similar in form, but without a coulter. Even the shovel-plough, not unlike the rude instrument still used by the Chinese, may be remembered by some, and was in common use in the cotton States a few years since. As early as 1765 the London Society of Arts awarded a gold medal to Benjamin Gale, of Killingworth, Connecticut, for a drill-plough, the invention of which was claimed by Benoni Hiliard, of the same place. The first patent taken out after the organization of the United States Patent Office was in June, 1797, by Charles Newbold, of Burlington, New Jersey, for the cast-iron plough already mentioned, which combined the mould-board, share and landside, all in one casting. He afterwards substituted wrought-iron shares, objections having been made to the cast iron probably because not chill-hardened. He did not succeed in getting them into permanent favor, although cast-iron ploughs were advertised for sale in New York in the year 1800, by Peter J. Curtenius, a large iron founder of the city. Newbold was paid one thousand dollars by David Peacock, a fellow-townsmen, who, in April, 1807, patented a modification of the iron plough, having the mould-board and landside cast separate, with a wrought-iron steel-edged share attached.

As early as 1798 Mr. Jefferson also exercised his mechanical tastes in improving the mould-board of ploughs, which he afterwards adapted to an improved plough sent him by the Agricultural Society of the Department of the Seine, in France. His son-in-law, Mr. Randolph, whom Mr. Jefferson thought probably the best farmer in Virginia, invented a side-hill plough, adapted for the hilly regions of that State, and designed to turn horizontally, in the same direction, the sides of steep hills, which, in northern Europe, was effected by a shifting mould-board, constituting the variety called turn-wrest ploughs. Colonel Randolph's plough was made with two wings welded to the same bar, with their planes at right angles to each other, so that by turning the bar, adjusted as an axis, either wing could be laid flat on the ground, while the other, standing vertically, served as a mould-board. Mr. Jefferson advocated an adherence to scientific principles in the construction of the plough. Perhaps the first attempt to carry out these suggestions was made by Robert Smith, of Pennsylvania, who, in May, 1800, took out the first patent for the mould-board alone of a plough. It was of cast iron, and of improved form, the principles of which were published by him. In July, 1814, Jethro Wood, of Scipio, New York, was granted a patent for a cast-iron plough having the mould-plate, share, and landside cast in three parts. The mould-plate combined the mechanical principles of the wedge and screw in raising and inverting the furrow-slice. It became the foundation of many patented improvements of later date, and of a handsome competence to the inventor, who, in 1819, received a second patent, which was renewed by act of Congress in 1832.

A series of improvements in the cast-iron ploughs was commenced about 1810 by Josiah Ducher, of New York, which were patented in 1822. Some of them are still retained in use. Two improvements in the cast-iron plough, designed to make it easier of draught, were covered by letters patent issued in April, 1821, to A. L. & E. A. Stevens, of Hoboken, New Jersey. One of these, was for hardening the cutting-edges and parts exposed to wear by cold-chilling them. Four other patents on the cast-iron plough were granted the same year. Much credit is also due to Joel Nourse, of Massachusetts, and his partners, for improving and perfecting the cast-iron plough, which was comparatively a rude instrument, in limited demand, as late as 1836, when they commenced the manufacture of agricultural implements at Worcester. The sale of twenty thousand ploughs in a single year by this firm, within twenty years after they commenced business, indicated the increased demand for ploughs, which they were able to supply, of one hundred and fifty different forms and sizes. Among these were *subsoil* ploughs adapted to teams of from one to six horses, the first implement of that kind in the United States having been imported by them in 1840 from Scotland, and subsequently improved by making it more simple, light, and cheap in construction. American hill-side ploughs are now exported to Great Britain. The number of patents granted for ploughs previous to 1830 was 124, and up to 1848 had reached between three and four hundred.

A distinctive feature in American ploughs is their great simplicity, lightness of draught, neatness, and cheapness, which is often in striking contrast with those of foreign make. This economy of power attracted attention to two ploughs sent, in 1815, to Robert Barclay, of Bury Hill, near Dorking, in England, by Judge Peters, president of the Philadelphia Society of Agriculture, the seal of which society, by the way, bears as a device a representation of the plough of the date of 1785. The ploughs referred to were made by order of Mr. Peters, to combine the best principles and forms of American ploughs, and when tested in August of that year against the best English ploughs, were found to do the work quite as well and as easily with two horses as the other did with four. American ploughs obtained favor with English farmers for substantially the same characteristics, namely, "extraordinary cheapness and lightness of draught," at the trial of ploughs at Hounslow during the great exhibition in 1851.

In the early part of this century the manufactories of ploughs in the United States were few and small in size. It has since become an important branch of the agricultural implement business. Ploughs were made and exported in considerable quantity at Enfield, Connecticut, previous to 1819. One of the largest establishments in this or any country, devoted chiefly to plough-making, was established in Pittsburg, Pennsylvania, in 1829. In 1836 it made by steam-power one hundred ploughs daily, of patterns adapted largely for the lower Mississippi, and cotton and prairie lands of the south and west. The iron-centre plough, and hill-side revolving beam-plough, were among the valuable modifications originated by the concern which now makes also the steel-ploughs so valued in prairie farming. Another steam-plough factory in Pittsburg made in 1836 about 4,000 ploughs annually, including wood and cast-iron ploughs, and a great variety of other kinds. These two factories, together, made 34,000 ploughs yearly, of the value of \$174,000. There are several other extensive and numerous smaller manufactories throughout the country, particularly in the western States, in which plough-making is carried on as a specialty. It forms, however, a branch of the general manufacture of agricultural implements. In the best conducted of these, machinery is extensively employed, and such a division of labor as to secure great speed and perfection of workmanship, as well as a great reduction of the cost. For each size and pattern of plough, the several parts subject to wear are made all alike, so as to fit any plough of that class, and allow it to be readily replaced without the aid of the plough-right. Sulky-ploughs, with a seat for the driver, and gang-ploughs, cutting several furrows at a time, have been introduced, but have not proved generally satisfactory. Rolling or wheel coulters have, in many cases, taken the place of the old standing coulter. Many ploughs now have a hook attached for turning the weeds under the furrow, an important improvement for prairie farms, where weeds, like other vegetation, are luxuriant.

Several attempts were made in 1858, and the following years to introduce steam-ploughs, for which the Illinois Central Railroad Company offered a premium of \$3,000. They have been employed with success for several years in Great Britain. English steam-ploughs are operated by stationary engines placed at one side of the field, and draw the plough from one side to the other by means of wire-chains. At other seasons the engines are used in driving threshing-machines and performing other farm labor. Our inventors have employed traction engines of several tons weight, which on hard ground worked satisfactorily, but on cultivated or moist soil were found to bury themselves inextricably in the ground. They appear to have been abandoned for the present.

A more recent machine, which promises to be a valuable one, is the rotary-spader, which, with the power of four horses, spades the ground eight inches deep and three feet wide, at the rate of five or six acres a day. It is rather too costly for small farms, but on large ones may prove valuable, and in time may be adapted to steam-power.

Many improvements have been made in implements for cultivating corn and other hoed crops, among which the horse-hoe or cultivator is exceedingly popular, and in corn-growing districts has nearly supplied the loss of manual labor by the war. The importance of frequently stirring the soil is becoming better understood, and in our dry climate the effects of severe drought may be almost entirely obviated by the use of the cultivator on rich, well-prepared lands.

## MOWERS AND REAPERS.

These implements, making so large an item in the manufacture, deserve a brief notice. The great breadth of land devoted to grain in the western country has rendered mechanical appliances for gathering the crop altogether indispensable to the farmer. But contrivances for that purpose have long been in use. Pliny the elder, in the first century of our era, gives us the earliest description of such an instrument in use among the Gauls. It was a large van, or cart, driven through the standing corn by an ox yoked with his head to the machine, which was fitted with projecting teeth upon its edge for tearing off the heads, which dropped into the van. It is supposed to have been in use for several centuries.

The earliest proposal in Great Britain for an implement for harvesting grain was made by the Society of Arts in 1780, when it offered its gold medal for a machine to answer the purpose of mowing or reaping grain, simplicity and cheapness in the construction to be considered as the principal part of its merit. The premium was continued for several years. William Pitt, of Pendeford, soon after invented a reaping-machine, suggested by the description of Pliny and Palladius, and described in Young's *Annals of Agriculture* for 1787. A second attempt was made in Lincolnshire, in 1793, by another person, whose name does not appear. In November of that year, two men named Cartwright, each invented a machine for mowing and reaping. In 1799 the first English patent was taken out by Joseph Boyce for a reaping-machine, acting on the principle of the common scythe. In the following year, Robert Mears, of Somersetshire, was granted a patent for a reaping-machine propelled on wheels, but worked by hand. In June, 1805, Thomas J. Plucknett, of Kent, received a patent for a reaper having the cutting apparatus suspended beneath and in front of the axle, and the power behind. He took out a second patent in 1807. Mr. Gladstone, of Castle Douglas, in 1806 invented a machine with horizontal gathering-wheel, and the next year Mr. Salmon, in Bedfordshire, brought forward a plan for raking the corn off a platform by means of a vertically-working rake driven by a large crank in the rear of the machine. Messrs. Kerr, of Edinburgh, in 1811 introduced the "conical drum," and in 1815 Mr. Scott employed rakes with a cylindrical drum, and projecting teeth, &c. In 1822, Mr. Ogle, of Alnwick, invented the large reel or rake for lashing the uncut grain towards the knife, as is now done in some English and American reapers. Some others were brought forward previous to 1826, in which year the Rev. Patrick Bell, of Scotland, produced the oldest machine now known to be in use, having a revolving apron or endless web for gathering, accompanied by Ogle's reel in front, which attracted little attention, however, until after the London exhibition in 1851, when he adopted McCormick's cutting apparatus; since which it has been used to some extent. From the closing of the fair in 1851, to the end of 1852, no less than twenty-eight patents were registered in England for inventions relating wholly or in part to reaping and mowing machines. Patents had been previously granted for this class of machines in Russia in 1831, in Austria in 1839, and in Australia in 1845. The last mentioned, introduced at Adelaide, South Australia, by Mr. Ridley, reaped, threshed, and winnowed all at the same time, at the rate of an acre per hour; but its description conforms very nearly to one patented by D. A. Church, of Friendship, New York, in 1841. Whether from intricacy of construction, or other inherent defect, or, as seems more probable, from indifference on the part of the public, none of these instruments came into permanent use, although they provoked the opposition of agricultural laborers.

The first American patent for cutting grain was issued in May, 1803, to Richard French and J. T. Hawkins, of New Jersey. Their machine was propelled on three wheels, one of which extended into the grain. Samuel Adams, of the same State, followed in 1805; J. Comfort, of Bucks county, Pennsylvania, and William P. Claiborne, of King William county, Virginia, in 1811; Peter Gaillard, of Lancaster, Pennsylvania, in 1812, and Peter Baker, of Long Island, New York, in 1814. The next was the machine of Jer. Bailey, of Chester county, Pennsylvania, patented in February, 1822, which was a rotary mowing-machine, having six scythes attached to a shaft. Four other patents were regis-

tered previous to 1828, when Samuel Lane, of Hallowell, Maine, patented a machine for cutting, gathering, and threshing grain all at one operation. It does not appear, however, to have been successful. Only one other machine, that of William Manning, of Plainfield, New Jersey, registered in 1831, and having several points of resemblance to some now in use, was patented previous to that of Obed Hussey, of Cincinnati, Ohio, in December, 1833. The first public trial with this instrument was made before the Hamilton County Agricultural Society, near Carthage, July 2, of that year. During the next it was introduced into Illinois and New York; in 1835 into Missouri; in 1837 into Pennsylvania; and in 1838 the inventor established his manufactory at Baltimore. In June, 1834, Cyrus H. McCormick, of Rockbridge county, Virginia, received his first patent for cutting grain of all kinds, by machinery, which was worked in 1831, improved since, proving a source of large profit to the proprietor, as well as a great boon to this country and foreign lands. From that time to the present nearly every year has produced one or more modifications of harvesting-machinery, among which may be mentioned that of Moore & Haskell, of Michigan, patented in June, 1836, which cuts, threshes, and winnows grain at the same time. From the date of this patent to the issue of McCormick's second patent, in 1845, fifteen other machines were registered, including that of W. F. Ketchum, of New York, in 1844, which has since obtained a high reputation. Since 1851, the new machines brought forward have been numerous. In June, 1852, twelve different reaping-machines and several mowers were entered for trial before the Ohio State Board as contestants for the premium, all of them—including McCormick's and Hussey's—possessing nearly equal merits.

The United States Agricultural Society, in 1857, instituted an elaborate trial of reapers, mowers, and implements, which took place at Syracuse, New York, in July of that year, when fifteen mowing-machines, nine reapers, and fourteen combined mowing and reaping machines were entered. Medals and diplomas were awarded to several. Among those entered were Pell's, Manny's, Haines's (Illinois Harvester), W. A. Woods's, (J. H. Manny's improved,) Seymour & Morgan's, Burrall's, Warder, Brokaw & Childs's, Atkins's, (automaton self-raker,) Moore & Patch's, and C. H. McCormick's, for reaping alone. Mowing-machines were entered by several of the same inventors, and also by Heath, Ketchum, Ball, Aultman & Miller, Hallenbeck, Kirby, Hovey, Allen, and Newcomb, and combined machines by some of the same parties, and by A. H. Caryl, Obed Hussey, J. H. Wright, and Dietz and Dunham.

The whole number of harvesting-machines produced in England and the United States up to that time amounted to 160 different kinds, about 100 of which were American; and in October, 1854, it had reached about 200.

The progress of ideas, or the different channels in which they have run in regard to the mode of action of the cutters of reaping-machines, has been shown by Bennett Woodcroft, esq., of England, in a patent office publication containing illustrations of sixty-nine examples of reapers, including nine American machines. In thirty-one of the number the motion of the knives was rectilinear, and in thirty-three it was circular, while in five the knives were moved by hand. Previous to the introduction of American reapers, the tendency in England was toward a circular action of the cutters; since that time reciprocating motion has been more employed. Although reciprocating and rectilinear motion was used by Salmon, in 1807, only two of the English machines introduced previous to 1862, viz: Ogle's and Bell's, were examples of that kind of motion, and three American, namely, Manning's, Hussey's, and McCormick's, while there were twenty-one of the other kind. Of later examples there were seventeen with reciprocating motion, to eleven with circular.

Diversities have also existed as to the mode of gearing the horse. Pitt's, Boyce's, Plucknett's, and Gladstone's machines were drawn behind the horses; Salmon's, Kerr's, Harke's, and other early English machines, were pushed before the horses, after the manner of the Romans and Gauls. In America both plans have been used, but since 1833 they have usually been placed behind the horses. By recently proposed improvements, horse-power harvesting-machines with four horses will cut twenty acres of grain in a day, at a net cost—including eight dollars for the use of the machine, a driver, two binders, and two hands to shock up—of ninety cents an acre, which harvested by hand would cost

\$1 90 per acre. The binding is now done with wire on the large grain-fields of the west, and a machine has lately been invented for performing that part of the labor. There can be little doubt that we shall soon have machines that will cut, gather, and bind up the grain at one operation. American reaping and mowing machines have now been introduced into every civilized country. Their usefulness has been universally acknowledged. In our own land, where labor is so high, and the season so short, they are indispensable. In many sections the labors of sowing and planting the spring crops are quickly followed by haying and harvesting. Corn, beans, potatoes, and other crops require the use of the hoe and cultivator. Summer fallows, for wheat claim attention at this time; and no sooner is the labor of harvesting over, than the American farmer is under the necessity of sowing his winter wheat, which in the northern and western States is sown from one to two months earlier than in England.

The nature of our climate, the character of our crops, the scarcity of labor, and the extent of our agricultural operations, all conspire to increase the introduction and use of these and all other implements and machines that will expedite the labors of the farm.

It is difficult to conceive that American agriculture could have attained its present condition had the invention of reaping and mowing machines been delayed thirty years. The extent to which they are already used is enormous.

The editor of the *Genesee Farmer*, Rochester, N. Y., has collected directly from the manufacturers the following statistics of the number of reaping and mowing machines made by a few of the leading firms engaged in this important branch subsequent to the returns of the census in 1860.

C. Aultman & Co., Canton, Ohio, made last year (1863) 3,100 "Buckeye" mowing and reaping machines, and this year (1864) 6,000 of the same machines.

Bomberger, Wight & Co., of Dayton, Ohio, have made 1,250 "Ohio Chief" reapers; and Rufus Dutton, who formerly manufactured the same machine, has made 3,156, making 4,306 in all.

Of the "Manny" reaping and mowing machine there have been manufactured in the State of Illinois, up to 1863, about *forty thousand*. In 1864 there have been made of the same machines in Rockford, Illinois, 10,500.

Messrs. Adriance, Platt & Co., of Poughkeepsie, New York, have also made 2,500 "Manny" machines for the New England States. The same parties have also manufactured 1,100 "Buckeye" machines for the New England States, New Jersey, &c.

S. M. Osborne & Co., of Auburn, New York, have made 15,000 of "Kirby's" mower and reaper. The Buffalo Agricultural Machine Works have also made 7,000, and other parties have made 5,000, making 27,000 of these machines that have been manufactured in the United States.

Messrs. Seymour, Morgan & Allen, of Brockport, New York, have made 7,200 of their "New Yorker" and other machines. Messrs. Warder & Childs, of Springfield, Ohio, also manufacture the same machine, and have made about 9,000.

The Messrs. McCormick Brothers have manufactured at their establishment in Chicago over 55,000 of their celebrated reaper—6000 in 1864.

The establishment of Mr. R. L. Howard, of Buffalo, New York, has manufactured 20,000 of the "Ketchum" mowing-machines, and 5,000 reapers and mowers combined, and 3,500 of the "Howard harvesters."

Mr. Walter A. Wood, of Hoosick Falls, New York, has made over 30,000 reaping and mowing machines. In 1858 Mr. Wood sent an agent to England with fifty; the next year he sent two hundred and fifty machines, and since then his sales in great Britain and on the continent of Europe have averaged over 1,000 per annum.

It thus appears that the manufacturers we have named have made two hundred and fourteen thousand and ninety-four mowers and reapers.

We present these facts, obtained directly from the manufacturers, that our readers may form some idea of the magnitude of the reaper and mower business. There are other machines manufactured of

which we have not ascertained the number, but we may safely conclude that there have been two hundred and fifty thousand reaping and mowing machines manufactured and in use in the United States; the importance of which may be estimated, when it is considered that a common reaper will cut from ten to twelve acres in a day of twelve hours, and a mower eight to ten acres in the same time.

Another valuable implement for facilitating harvesting operations is the hay-unloading fork, with which, by the aid of a horse, a load of hay can be elevated to the stack or mow in a few minutes. Several varieties of these useful little machines are manufactured, and tens of thousands are already in successful use.

The wooden revolving hay-rake, (invented by Moses Pennock, of Pennsylvania, in 1824, and now well known in all parts of the country,) also greatly lessens the labor of haying. Fine steel-toothed rakes leave less hay on the ground, but for general use on American farms this wooden revolving hay-rake is one of the most simple, useful, and efficient machines yet invented. On large farms, the sulky wire-tooth rake is fast superseding all others. They throw the windrow into heaps or bundles of eighty or one hundred pounds each, ready for cocking or loading. A boy and horse can thus rake and bunch twenty acres a day. The hay-fork, or patent pitch-fork, is another recent improvement of value.

FOR THRESHING AND CLEANING GRAIN, we have machines which are confessedly unsurpassed. In our preliminary report we gave an outline of the progress of invention in this class of implements.

Nearly all threshing-machines now in use have an apparatus for separating the grain from the straw and chaff, and carrying the straw up on to the stack. This simple apparatus is now so common that it attracts no notice, except from the English or continental visitor, to whom it is a novelty. Many machines have also an apparatus for bagging the grain when clean.

The English threshing-machines, especially those drawn by steam, have a much more finished appearance, but for simplicity and efficiency they are in no way superior to those of American manufacture. In fact, wherever the American threshing-machines have come into direct competition with those of British and European construction, the American machines have proved superior.

#### SCYTHES.

Although the genius of modern improvement promises ere long to rob haymaking of one element of the picturesque, it has not yet wholly succeeded in banishing the hand-scythe and mower from modern scenery. Tedious and laborious as its use appears, compared with that of the mowing-machine, it is wonderfully effective in comparison with the rude practice of the Mexican of our day, who cuts his grain and hay by handfulls with a common knife. It may not be generally known that the most valuable improvement made upon this implement for centuries was by one of the first iron-workers of Massachusetts, more than two hundred years ago, in the very infancy of the colony. In the year 1646 the general assembly of that province granted to Joseph Jenckes, of Lynn, a native of Hammersmith, in England, and connected with the first iron-works in that colony, the exclusive privilege for fourteen years "to make experience of his abillities and inventions for making," among other things, of "mills for the making of sithes and other edge-tooles." His patent "for ye more speedy cutting of grasse" was renewed for seven years in May, 1655. The improvement consisted in making the blade longer and thinner, and in strengthening it at the same time, by welding a square bar of iron to the back, as in the modern scythe, thus materially improving upon the old English scythe then in use, which was short, thick, and heavy, like a bush-scythe.\*

The introduction of the scythe and axe manufacture into Massachusetts, Connecticut, and Rhode Island, is to be in a great measure ascribed to Hugh Orr, a Scotchman by birth, who came to Massachusetts about 1737, and a year or two after erected at Bridgewater the first trip-hammer probably in the colony. He engaged in the manufacture of scythes and other edge-tools, in which he acquired a wide reputation. His son, Robert Orr, by successful experiments, established the improved manufac-

ture of scythes by the trip-hammer, and also introduced the iron shovel manufacture into the State. As early as 1766, samples of home-made scythes, shovels, spades, hoes, &c., were laid before the Society of Arts, in New York, and approved. They were probably from the manufactory of Keen & Payson, of that neighborhood, whose improved scythes, often called Salem scythes, then claimed to be superior in quality and form to any others. The non-importation and non-intercourse of the revolutionary period, and during the last war with England, encouraged the domestic manufacture of scythes and other articles of hardware, which, before the end of the last century, were made in different parts of New England in considerable quantity. Scythes were made in Plymouth county, Massachusetts, and to the number of two or three hundred dozens annually, at Canton, in Norfolk county, and also at Sutton, in Worcester county, which town had in 1793 seven trip-hammers and five scythe and axe factories. In 1810 there were nine factories in Sutton, and two in Oxford, and in 1814 seven others had been erected in the county, some of which could make 1,000 dozens annually. Scythes were at the same time made in Boston, and in 1803 the manufacture was commenced at Orange, by Levi Thurston, who employed in it the first tilt-hammer in the town. A few years later there were two scythe factories at Colebrook, in Litchfield county, Connecticut, which county in 1820 returned the largest manufacture of scythes of any in the Union. At Southfield, Rhode Island, large numbers of scythes were made at that time for exportation. As early as 1812, the scythe factory of S. & A. Waters, at Amsterdam, in Montgomery county, New York, turned out about 6,000 scythes annually. They were made at many small establishments throughout the Union, along with axes, sickles, and other edge-tools and cutlery, shovels, &c., by the aid of the trip-hammer, and were in good demand. The price in 1820 ranged from twelve dollars to eighteen dollars per dozen.

About the latter date was commenced, at West Fitchburg, Massachusetts, one of the oldest scythe factories now in the country, then owned by F. T. Farwell & Co., which in the hands of its original and later proprietors has originated many improvements in the manufacture, and given reputation to its well-known brand. At a later period, Harris's scythes, extensively manufactured at Pine Plains, in Dutchess county, New York, obtained a high repute, and are said to have been counterfeited in England. The mammoth scythe factory of R. B. Dunn, at North Wayne, in Maine, was a few years ago considered the largest in the world. In 1849 it turned out 12,000 dozens, requiring 450,000 pounds of iron, 75,000 pounds of steel, 1,200 tons of hard coal, 10,000 bushels of charcoal, 100 tons of grindstones, and half a ton of borax. About the same time, the scythe and cast-steel fork manufactory of D. G. Millard, near the village of Clayville, New York, made about 13,000 dozens of scythes and forks annually, by water-power. In 1860 Massachusetts was the largest producer of scythes, returning \$168,550 as the aggregate value of the product of ten establishments. Maine ranked second in the value of its scythe manufacture—\$129,363 by three factories. In New York, four establishments turned out scythes worth \$117,440, and one factory in Rhode Island employed 100 hands, producing to the value of \$100,000. The total value of scythes made in 1860 was \$552,753, which was the product of twenty-two factories and 474 hands.

#### SHOVELS, SPADES, HOES, AND FORKS.

These articles, intimately but not all so directly connected as the foregoing with agriculture, in 1860 gave employment, in five States, to forty-three establishments, the value of whose manufacture was \$1,452,226. The hands engaged in them numbered 1,015. Upward of one-half the whole value was made in eleven factories in Massachusetts, which, together, employed 578 workmen, and produced an annual value of \$777,048, being relatively much the largest concerns in the country. In New York there were twenty-three manufactories, whose product was \$307,428, and the number of hands employed 233. Six factories in Pennsylvania employed 177 men, and produced wares to the value of \$312,450.

The manufacture of these articles has long been an established industry in Massachusetts and some other States, having been commenced before the Revolution. The shovel manufacture was successfully introduced at an early period at Easton and Bridgewater, in Massachusetts, where the Messrs. Orr, before mentioned, were instrumental in establishing it by the use of the tilt-hammer. In 1788 the iron-plate shovels made at Bridgewater were deemed superior in workmanship to the foreign article which they undersold. The Easton shovel manufactory—commenced on a small scale nearly sixty years ago by the late Oliver Ames—made in 1822 about 2,500 dozen annually. The proprietor in 1827 took out a patent for improvements in the manufacture, which contributed to give his wares a high reputation, and greatly to extend and perfect the business of his establishment. In 1835, Oliver Ames & Sons had large manufactories at Easton, Braintree, and West Bridgewater, which employed nine tilt-hammers, and were capable of making forty dozen spades and shovels per diem, each shovel passing through the hands of twenty different workmen. They now run twenty-six tilt-hammers, and produce two hundred and fifty dozen per diem. In 1822 three factories in Plymouth county, Massachusetts, made from one to two thousand dozens each per annum. In 1831, it was estimated that about 5,000 dozens of shovels, worth \$35,000, were made in New York State annually. It was computed that Litchfield county, Connecticut, at the same date made shovels and spades to the value of \$6,500, hoes worth \$7,150, pitchforks to the value of \$20,000, and scythes valued at \$56,000. A steel shovel and spade factory in Philadelphia consumed annually about fifty tons of American steel. The sheet-iron shovel was patented in 1819, and cast-steel shovels in 1828. The first American patent for improvement in hoes was registered in 1819, and for cast-steel hoes in 1827, by C. Bulkley, of Colchester, Connecticut. But cast-steel hoes were made in Philadelphia by at least two manufacturers in 1823. In Pittsburg, Pennsylvania, where scythes, sickles, hoes, shovels, and other hardware was made in considerable amount previous to 1803, Messrs. Foster & Murray carried on the manufacture by steam-power in 1813. On account of the fall in the price of iron and steel, superior steel hoes were made in Pittsburg in 1831 for about \$4 50 per dozen, or one-half the price of iron hoes ten years before. Socket-shovels were made at nearly the same price, which was about one-third their former price. Two large establishments in that place in 1836 made annually about 1,600 dozen steel hoes, 800, dozen of shovels and spades, 950 dozen steel and other hay and manure forks, and 600 dozen saws. Four establishments in 1857, in addition to nearly half a million dollars' worth of axes, made 32,000 dozen of hoes, worth \$208,000, and 11,000 dozen of planters' hoes, worth \$94,000, besides picks, mattocks, vices, saws, &c. The Globe Sickle Factory, in the same place, produced a superior article of sickles to a greater value than all the other factories in the United States. The Steel spring pitchfork was introduced by the late Charles Goodyear, by whom it was patented in September, 1831, at which time, and for several years previous, he was engaged with his father, Amasa Goodyear, in the manufacture and sale of hay and manure forks, and other hardware. Their store in Philadelphia is believed to have been the first in the United States for the sale of American hardware exclusively; but the failure of the business during the commercial troubles of that period led the junior Goodyear to abandon it for the new manufacture of India-rubber goods, with which his name will be ever associated in the annals of industry.

A firm in Philadelphia now manufactures eyeless or solid axes, hoes, picks, shovels, &c. The instrument is made solid, while the handle with which it is to be worked has upon the end an iron socket through which the pick, &c., is put, and kept in its place by an iron wedge. The handle does not become loose, and will answer for any number of tools of the same size, and the blow is rendered more effectual. Many of these tools have been exported to California, where they are prized by the miners.

There can be no doubt that our agricultural tools, such as hoes, forks, rakes, &c., are in most respects superior to those in common use in Europe. An English gentleman, who has spent some time in this country, says: "For lightness and finish, combined with strength and durability, American forks and hoes are superior to all others."

Dr. Hoyt, alluding to the great international exhibition in London, in 1861, says: "Among the minor implements of agriculture, we were both surprised and gratified to find a collection of American

forks and hoes. The exhibitor was a sensible English dealer, who, discovering the superiority of this class of American implements as compared with articles of the same description manufactured in his own country, has for years been importing and selling them to his customers. On being asked why English manufacturers did not make them, he replied: 'We can't do it; have been trying ever since the great exhibition of 1851, but somehow don't succeed. It is a mortifying admission to make, but it is nevertheless true, that you Yankees have a knack of doing some things which we have not the skill to imitate.'

#### COTTON-GINS.

Although cotton-gins are made by a few establishments in the northern States, their manufacture is principally a southern one, and amounted in 1860 to the value of \$1,077,315, which was the product of fifty-five establishments, all but three of them southern. Alabama is the largest manufacturer of machinery for cleaning cotton, having sixteen factories, employing 178 hands, and producing gins to the value of \$434,805. Georgia ranks next, having twelve establishments, whose product exceeded a quarter of a million. The manufactories of cotton-gins in Mississippi are relatively the largest, three factories employing seventy hands, and returning an aggregate product of \$131,900. In Texas, where the first cotton-gin was erected about 1823, there are four manufactories of gins. Many of these machines are made in northern machine-shops, along with other cotton machinery, from which they are inseparable in the general estimate of value.

The history of the cotton-gin furnishes one of the most remarkable examples on record of the power of a single labor-saving machine to influence the social and industrial interests, not merely of a single nation, but in a great measure of the civilized world. The simple mechanism of the saw-gin invented by Whitney enabled one farm-hand to separate the seed from 300 pounds of cotton fibre in a day, instead of one pound, as he had been able to do by hand. Its introduction at the particular period when the completion of the brilliant series of inventions for carding, spinning, and weaving cotton had created a demand for the raw material, at once directed into a new and profitable channel the agriculture of the south, and at the same time furnished the manufacturing industry of Europe and America with one of the most valuable staples, and the shipping and commercial interests of the world with an enormous trade in its raw and manufactured products. The increase in the growth and exportation of raw cotton which followed has no parallel in the annals of industry, save in the wonderful development of its manufacture in England and the United States. The effects of this growth of the husbandry and manufacture of cotton in increasing national wealth, in furnishing employment to labor and capital, and in increasing the comfort of all classes, can scarcely be conceived in all its magnitude.

In 1792, the year preceding the introduction of the saw-gin, the amount of cotton exported from the United States was only 138,328 pounds, and the total domestic consumption was about five and a half millions of pounds. During the next year there were exported nearly half a million pounds; in 1794, 1,601,700 pounds; in 1795, 5,276,300 pounds; and in 1800, 17,789,803 pounds.\* In 1860 the production of ginned cotton in the southern States amounted to 5,198,077 bales of 400 pounds each, or 2,079,230,800 pounds, which was more than seven-eighths of the total production of cotton throughout the world. The quantity exported in that year was 1,765,115,735 pounds, equivalent to 4,412,789 bales of 400 pounds each. To prepare this large amount of cotton for market by the primitive methods would have been utterly impracticable. Not only is the labor of the planter facilitated and cheapened by the use of the machine, but the cotton is much better cleaned than by the old methods, which left it unsuitable for the finer fabrics.

Although the earliest mode of separating cotton from the seed, and the one chiefly practiced in the cotton States previous to the invention of the saw-gin, was to separate the seed with the fingers; yet mechanical contrivances for that purpose have been long in use, having been chiefly borrowed from

India, the cradle of the cotton culture and manufacture. In that country the practice of beating out the seed was long in use. A more effectual modification of the same method, employed for centuries in eastern countries, and very early introduced into Georgia, which took the lead in cotton husbandry, was the bow-string operation. It consisted in the employment of a long bow fitted with a multitude of strings, which being vibrated by the blows of a wooden mallet while in contact with a bunch of cotton, shook the seed and dust from the mass. Hence upland or short staple cotton became known in commerce as "bowed cotton." A form of the roller-gin appears also to have been used in India in early times, as mentioned by Nearchus, and consisted of two rollers of teak-wood fluted longitudinally, and revolving nearly in contact. In 1728 we find mention of "little machines, which being played by the motion of a wheel, the cotton falls on one side, and the seed on the other, and thus they are separated."

About the year 1742, M. Dubreuil, a wealthy planter of New Orleans, invented a cotton-gin which was so far successful as to give quite an impulse to the cotton culture in Louisiana, but nearly forty years later the colonial authorities in Paris recommended the importation of machinery from India for cleaning the seed.

Early in the Revolution, Kinzey Borden, of St. Paul's Parish, South Carolina, constructed a roller-gin, believed to have been the first ever used in that State for cleaning the long staple and silky cotton, of which he was one of the first cultivators. It consisted of pieces of burnished iron gun-barrels secured by screws to wooden rollers turned by wooden cranks, like a steel corn-mill. A Mr. Bisset, of Georgia, in 1788, contrived a gin having two rollers revolving in opposite directions, operated by a boy or girl at each, by which five pounds of cleaned cotton was made per diem. Nothing but hand-gins, resembling the cotton hand-mills of India, were yet known in the south, although foot or treadle gins appear to have been in use at this date in Philadelphia and vicinity, some cotton being then raised in New Jersey, Maryland, and Delaware. A great improvement in the treadle gin was made about the year 1790, by Joseph Eve, of Providence, Rhode Island, then residing in the Bahamas, and was patented by him in 1803. It was a double gin, with two pairs of rollers placed obliquely one above the other, and by adding iron teeth and pulleys, was made by a little assistance to feed itself. It could be worked either by horse or water power. Mr. Pottle, of Georgia, substituted two single rollers for the double ones, and produced a gin very popular in that State for some time. The present form of foot or treadle gin was first introduced into Georgia from the Bahamas, in 1796. It was improved in 1820 by Mr. Harvie, of Berbice, who obtained a patent, and afterwards by another person, who obtained a patent in the United States for making the rollers hollow, to prevent them from becoming hot while revolving. Other improvements on the roller-gin were patented in 1823, and subsequent years by Eleazer Carver, of Bridgewater, Massachusetts, who in 1807 commenced the manufacture of saw and roller gins in Mississippi and Louisiana, then a new country without saw-mills—of which he erected one of the first in these territories—or any machinery for manufacturing the several parts. The Whittemores, of West Cambridge, also secured patents for improvements on the roller-gin, which was in some respects superior to all others, but was found to injure the staple, and was abandoned. Other modifications of these machines were introduced by Birney, Simpson, Nicholson, Farris, Logan, Stevens, McCarthy, and others, several of which were popular in their day, and preferred in certain sections of the cotton States. The machines of Farris and Logan were improvements upon Eve's mechanism, and at a recent period were still used to some extent with steam-power. Jesse Reed, of Massachusetts, inventor of the tack-machine, patented cotton-gins in 1826 and 1827, the latter for cleaning Sea Island cotton, and the eminent American inventors, Jacob Perkins and Isaiah Jennings, each labored in this field. The roller-gin is especially adapted for cleaning the long staple or Sea Island cotton, the long, silky, delicate fibre of which is injured by the saw-gin. In the original machines, a pair of rollers worked by one hand would make about twenty-five pounds of clean cotton in a day. A recent improvement by Mr. Chichester, of New York, consisting of a fluted roller of polished steel, and one of vulcanized rubber, &c., is said to clean 300 pounds per diem, without crushing a seed. The Parkhurst

roller-gin, though costly, is deemed a superior machine in Alabama and other cotton districts. The Louisiana cylinder-gin for short staple cotton, made by Jenks, of Bridesburg, Philadelphia, is also much esteemed for completely removing all extraneous matters without injury to the fibre. But as the Upland short staple, or black-seed cotton, was the first variety cultivated in the south, a means of removing the seed from its tenacious envelope was early sought, and happily supplied by the genius of Eli Whitney, a native of Worcester county, Massachusetts, under the patronage of the widow of General Greene, of Georgia, and her husband, Mr. Miller. Whitney's saw-gin, patented in March, 1794, was the first cotton-cleaning machine recorded in the United States Patent Office. Its appearance produced intense excitement, and numerous infringements of his patent rights, which involved him in expensive and vexatious lawsuits, and finally drove him into other enterprises, in which his ingenuity achieved reputation and success. In 1796 Whitney and partner had thirty machines in operation in Georgia by animal or water power, and in December, 1801, the legislature of South Carolina purchased the right for that State at a cost of \$50,000, and threw it open to the public. One of the early invasions of the patent was by Hogden Holmes, of Georgia, who also patented a saw-gin in 1796. Two other Georgians the same year took out patents for saw-gins, and in 1803 another was taken for a saw-gin by G. F. Saltonstall, of North Carolina. Among other improvements on gins made by Mr. Carver, before mentioned, who had long experience in their manufacture, was the grate patented by him in 1823, which being placed where the seed is arrested and the fibre taken from it by the saw, prevented clogging, and the delay of cleaning the saw, &c. In 1837 he patented an improvement in ribs for saw-gins. Mr. McCarthy in 1840 connected a vibrating saw to the roller-gin, adapting it for cleaning both green and black seed cotton. This machine it was thought would supersede Whitney's, the fibre cleaned by it having brought three cents per pound more in the Mobile market than that cleaned by the latter.

The manufacture of cotton-gins has long formed a branch of business in the machine-shops of the northern and middle States, and an independent business in several southern cities. One of the earliest and most extensive of these concerns was that of Samuel Griswold, at Clinton, Georgia. In 1833 the business was commenced in Autauga county, Alabama, by Daniel Pratt, a native of New Hampshire, who had learned the business with Mr. Griswold. He there manufactured cotton-gins of superior quality for the neighboring southwestern States, including many for Texas, and even New Mexico, and acquired reputation and fortune in supplying the great demand, which required a branch house in New Orleans. His large accumulations were employed in erecting saw and planing mills, one of the first flouring-mills in Alabama, grist-mills, large cotton and cotton-gin factories, and other factories and tenements, forming the flourishing village of Prattville, where in 1851 he employed 200 hands, and made annually about 600 gins. He had manufactured since 1833 upwards of 8,000 cotton-gins. In 1846 he received from the University of Alabama the honorary degree of *master in the mechanic arts*, for the intelligent and benevolent exercise of his mechanical ingenuity and ample means.

We have thus very briefly, as compared with the importance of the subject, given a sketch of the rise and progress of the manufacture and introduction of some of the most important implements connected with husbandry. To some it might seem a subject better discussed in the volume on manufactures; but believing it to be one of special interest to agriculturists, we have not hesitated respecting the propriety of incorporating the facts in a volume prepared especially for the farmers of the country, with whose tastes and progress we feel a deep interest, and whose advantages in late years we can appreciate from experience. We hope we may be pardoned for referring in a public work to our personal experience in stating that, as recently as 1849, when we relieved ourselves of the cultivation of a farm in Pennsylvania to take charge of the census, nearly all the operations of agriculture, except that of threshing the grain, were performed by manual labor; and the number of workmen to be provided for, especially during the period of harvest, rendered several months of the year a season of family solicitude and drudgery. On the same farm the crops of the past year were sown and gathered in a much shorter time, in better condition, with one-fourth the number of laborers—the grain being cut by machinery, and the grass mown, loaded on the wagon, and transferred therefrom to mow by

means of mechanical appliances. The effects of such changes upon the character of the rural population of our country will soon manifest themselves by their elevating influences.

## WHEAT.

*Bushels of wheat produced in 1860.*

## STATES IN THE ORDER OF THEIR WHEAT PRODUCT IN 1850 AND IN 1860.

The census of 1850 showed that Pennsylvania produced more wheat in 1849 than any other State in the Union, 15,367,691 bushels. Ohio ranked second, producing 14,487,351; New York stood third on the list, 13,121,498; Virginia came next, 11,212,616; Illinois stood fifth, 9,414,575; Indiana, sixth, 6,214,458; Michigan, seventh, 4,925,889; Maryland, eighth, 4,494,680; Wisconsin, ninth, 4,286,131; Missouri, tenth, 2,981,652; Kentucky, eleventh, 2,142,822; North Carolina, twelfth, 2,130,102; Tennessee, thirteenth, 1,619,386; New Jersey, fourteenth, 1,601,190; Iowa, fifteenth, 1,530,581; Georgia, sixteenth, 1,088,534; South Carolina, seventeenth, 1,066,277; Vermont, eighteenth, 535,955; Delaware, nineteenth, 482,511; Maine, twentieth, 296,259; Alabama, twenty-first, 294,044; Oregon, twenty-second, 211,943; Arkansas, twenty-third, 199,639; New Hampshire, twenty-fourth, 185,658; Mississippi, twenty-fifth, 137,990; Connecticut, twenty-sixth, 41,762; Texas, twenty-seventh, 41,729; Massachusetts, twenty-eighth, 31,211; California, twenty-ninth, 17,228; Minnesota, thirtieth, 1,401; Florida, thirty-first, 1,027; Louisiana, thirty-second, 417; Rhode Island, thirty-third, 49 bushels; Kansas, no report.

The census of 1860 (crop of 1859) placed Illinois, which was fifth in 1850, at the head of the list in 1860—23,837,023 bushels.

Indiana, which was sixth in 1850, was second in 1860—16,848,267.

Wisconsin, which was ninth in 1850, was third in 1860—15,657,458.

Ohio, which was second in 1850, drops to fourth in 1860—15,119,047, though showing an actual increase of 631,696 bushels.

Virginia shows an increase in the last decade of 1,918,361 bushels, but nevertheless stands fifth in 1860, instead of fourth, as in 1850.

Pennsylvania, which stood first in 1850, is now sixth, with an actual decrease of 2,325,526 bushels and 10,794,858 less than Illinois.

New York stands seventh—8,681,105 bushels. In 1850 she stood third, producing 13,121,498, showing a decrease in ten years of 4,440,393 bushels.

Iowa, which was fifteenth in 1850, now stands eighth, producing 8,449,403 bushels, against 1,530,581 in 1850, showing an increase of 6,918,822.

Michigan, which was seventh, is now ninth, though the produce of wheat has nearly doubled. In 1850 it was 4,925,889 bushels; in 1860—8,336,368.

Kentucky, which was eleventh in 1850, is now tenth—7,394,809 bushels—showing an increase of 5,251,987.

Maryland, which was eighth in 1850, falls to the eleventh in 1860—6,103,480 bushels—though showing an increase of 1,608,800.

California, which was twenty-ninth in 1850, is now the twelfth wheat-producing State in the Union. In 1850 she produced but 17,228, while in 1860 she produced 5,928,470 bushels, being nearly as much as Indiana (which stood sixth) produced in 1850.

Tennessee, again, as in 1850, stands thirteenth, producing, however, 5,459,268, against 1,619,386 bushels in 1850.

North Carolina, which was twelfth in 1850, now ranks only as fourteenth, producing, however, 4,743,706 bushels, being an increase of 2,613,604.

Missouri, which was tenth in 1850, is now fifteenth, producing 4,227,586 bushels, showing an increase, however, of 1,245,934.

Georgia, in 1860, stands sixteenth, as in 1850, in order, producing 2,544,913, against 1,088,534 bushels in 1850.

Minnesota, which was thirtieth in 1850, now occupies the seventeenth rank, having increased the produce of wheat from 1,401 bushels in 1850 to 2,186,993 in 1860.

New Jersey, which was fourteenth in 1850, is now eighteenth, with a product of 1,763,218 bushels, showing an increase of only 162,028 in ten years.

Texas, which was twenty-seventh in 1850, is now nineteenth, producing 1,478,345, against 41,729 bushels in 1850.

South Carolina, which was seventeenth in 1850, is now twentieth, producing 1,285,631 bushels in 1860, against 1,066,277 in 1850.

Alabama is again twenty-first, as in 1850, producing 1,218,444 bushels in 1860, or 924,400 more than in 1850.

Arkansas is now, as in 1850, twenty-second, producing 957,601 bushels, being an increase of 757,962 in ten years.

Delaware, which in 1850 was nineteenth, stands now twenty-third, producing 912,941 bushels, against 482,511 in 1850.

Oregon, which stood twenty-second in 1850, is now twenty-fourth, producing 826,776 bushels in 1860, against 211,943 in 1850.

Mississippi is again twenty-fifth, as in 1850, producing 587,925 bushels, against 137,990 in 1850.

Vermont, which was eighteenth in 1850, is now twenty-sixth, producing only 437,037 bushels, against 535,955 in 1850, or a decrease of 98,918 bushels in ten years.

New Hampshire, which was twenty-fourth in 1850, is now twenty-seventh, producing 238,965 bushels in 1860, against 185,658 in 1850, or an increase of 53,307 bushels in ten years.

Maine, which was twentieth in 1850, is now twenty-eighth, producing 233,876 bushels in 1860, against 296,259 in 1850, or a decrease of 62,383 bushels.

Kansas, which was unreported in 1850, now stands twenty-ninth, producing 194,173 bushels, taking the same relative rank occupied by California in 1850, but which stands twelfth in 1860.

Massachusetts, which was twenty-eighth in 1850, is now thirtieth, producing 119,783 bushels, against 31,211 in 1850, showing an increase of 88,572.

Connecticut, which was twenty-sixth in 1850, is now thirty-first, producing 52,401 bushels, against 41,762 in 1850, showing an increase of 10,639.

Louisiana continues thirty-second, as in 1850, though producing 32,208 bushels, against 417 in 1850.

Florida, which was thirty-first in 1850, is now thirty-third, producing 2,808 bushels in 1860, against 1,027 in 1850.

Rhode Island, which was thirty-third, is now thirty-fourth, producing 1,131 bushels in 1860, against 49 in 1850.

#### PRODUCTION OF WHEAT IN PROPORTION TO POPULATION.

In 1850, the United States and Territories, with a population of 23,191,876, exclusive of Indian tribes, produced 100,485,944 bushels of wheat, or 4.33 bushels to each inhabitant.

In 1860, with a population, exclusive of Indian tribes, of 31,443,322, there were 173,104,924 bushels of wheat produced, or 5.50 bushels to each inhabitant, showing an increase of one bushel and one sixth to each inhabitant, or an increase in proportion to population of over twenty-five per cent.

The New England States, with a population of 2,728,116 in 1850, produced 1,090,894 bushels, or only thirteen quarts to each inhabitant. In 1860, with a population of 3,135,283, the New England States produced 1,083,193 bushels, or about eleven quarts and a half to each inhabitant.

The middle States, (New York, Pennsylvania, New Jersey, Maryland, and Delaware,) in 1850, with a population of 6,573,301, produced 35,066,570 bushels, or five and one-third bushels to each inhabitant. The same States in 1860, with a population of 8,258,150, produced 30,502,909 bushels, or about three and two-thirds to each inhabitant.

The western States, (Ohio, Michigan, Wisconsin, Illinois, Iowa, Missouri, Minnesota, Kentucky, Indiana, and Kansas,) in 1850, with a population of 6,379,723, produced 46,076,318 bushels, or seven and a quarter to each inhabitant. The same States in 1860, with a population of 10,218,722, produced 102,251,127 bushels, or ten to each inhabitant.

The southern States, (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, and Texas,) in 1850, with a population of 7,349,472, produced 17,795,761 bushels, or nearly two and a half to each inhabitant. The same States in 1860, with a population of 9,103,332, produced 31,441,826 bushels, or three and a half to each inhabitant.

The fifteen slaveholding States, in 1850, with a population of 9,698,487, produced 27,897,426 bushels, nearly three to each inhabitant. The same States in 1860, with a population of 12,112,683, produced 50,080,642 bushels of wheat, or a little over four to each inhabitant.

The non-slaveholding States and Territories, in 1850, with a population of 14,492,389, produced 72,588,518 bushels, or five to each inhabitant.

The same States and Territories in 1860, with a population of 19,330,639, produced 123,024,282 bushels of wheat, or about six and one-third bushels to each inhabitant.

To recapitulate: The production of wheat in the whole United States and Territories was four and one-third bushels in 1850 to each inhabitant, and in 1860 five and a half bushels to each inhabitant.

In the New England States the production of wheat in 1850 was thirteen quarts to each inhabitant, and in 1860 only eleven quarts.

In the middle States the production of wheat in 1850 was five and one-third bushels to each inhabitant, and in 1860 three and three-fourths bushels.

In the western States the production of wheat in 1850 was seven and a quarter bushels, and in 1860 nine and three-fourths bushels, to each inhabitant.

In the southern States the production of wheat in 1850 was two and a half bushels, and in 1860 three and a half bushels, to each inhabitant.

In the entire slaveholding States the production of wheat in 1850 was three bushels, and in 1860 four bushels, to each inhabitant.

In the free States and Territories the production of wheat in 1850 was five bushels, and in 1860 six and a quarter bushels, to each inhabitant.

Taking the country as a whole, therefore, there has been a gratifying increase in the production of wheat as compared with population; an increase of one bushel to each inhabitant, or about twenty-five per cent.

In the western States the increase in proportion to population has been, as was to be expected, much larger than in any other section—an increase of two and a half bushels to each inhabitant, or an actual increase of over thirty-three per cent.

In the slaveholding States, taken as a whole, the increase was one bushel to each inhabitant, against one and a quarter bushels increase in the free States. The increase per cent, however, is greater in the slave States than in the free States, being thirty-three per cent. in the former, against twenty-five per cent. in the latter. The production of wheat in proportion to the population was much lower in 1850 in the slaveholding than in the free States.

In New England the production of wheat, little as it was in 1850, is even less in 1860. It was only thirteen quarts to each inhabitant in 1850, and in 1860 about eleven and a half quarts.

New England is almost entirely dependent upon the western States for breadstuffs. That wheat can be grown in the New England States there is abundant evidence. Wheat forms the principal bread-food of a large portion of all civilized nations, and has a wider range of habitat than any other cereal. There is scarcely a soil in which it cannot be grown, at least occasionally. We have seen as good wheat produced in Connecticut as in western New York or in Ohio.

It has been said that the reason why New England produces so little wheat is on account of the exhaustion of the soil. We believe the soil proper is as rich to-day in New England as it ever was, and that it can be made highly productive has been proved in repeated instances. The soil of New England, however, never was well adapted to the production of wheat. John Adams, of Quincy, Massachusetts, in a letter written to Elkanah Watson, in 1812, says: "Full fifty-five years have I observed, inquired, read, and tried experiments to raise wheat in New England. *The result is total despair.*"

In another letter to the same gentleman, written about the same time, he alludes to the experiments of Josiah Quincy with Siberian wheat as follows:

"He (Mr. Quincy) succeeded very well; had a fine crop, which suffered nothing from the Hessian fly, mildew, blasting, or weevil. Enthusiasm was excited in the neighborhood; all the seed he could spare was purchased at a high price for sowing. My wife purchased some bushels; others more. Quincy himself sowed the greatest part of all he had. Expectations were high that it would become the staple of New England. *The next year we all failed*; every plant of it blasted, and seed, labor, and all were totally lost."

"Notwithstanding all this," he further says, "I have no doubt wheat may be raised in Massachusetts as well as anywhere else; but the land must be under proper cultivation, particularly manured abundantly, the seed sown so early that it may be forward and vigorous enough to bear the winter, and start early enough in the spring to shoot the grain and ear forward before the season of insects. But this process, which *I know has succeeded*, and will succeed, is expensive, and the wheat will not procure a price equal to the labor."

There is here nothing to indicate that the soil of New England was ever very well adapted to the production of wheat, and that it has been exhausted by tillage. The reason so little wheat is raised in those States is simply, as Mr. Adams says, "it will not procure a price equal to the labor." Other crops pay better.

In the middle States the production of wheat is also less in 1860 than in 1850 by some four and a half millions of bushels, while during the same period the population increased over one and a half million.

There are several causes which conspire to produce this result. Competition with the west, and consequent low prices, is one cause; want of capital to admit of a higher system of farming generally, another.

Agriculture in the middle States is in a transition state. We have abstracted from the soil nearly all the accumulated organic matter derived from natural sources, and have not yet fully realized the necessity of enriching the soil by the application of manure. Farmers have been proverbially slow to adopt new ideas and practices. Many continue to grow wheat in the same manner, and with as little preparation, as when the country was new, and the soil abounded in available plant-food. They fail to get as good crops as formerly; but too many persevere in the old way, hoping for better success, and of course are disappointed.

In the middle States we must make more manure, and cultivate our land better, before we can reasonably expect to grow good crops of wheat. There are many farmers who understand this, and are doing their utmost to enrich their land, but the majority put in their wheat without any manure whatever, and obtain small crops in consequence. Others, discouraged with their failures to obtain remunerative crops, have abandoned wheat culture altogether, or greatly reduced the number of acres sown.

The advent of the midge is another reason for the falling off in the production of wheat in the middle States. This insect, according to the late Dr. Thaddeus W. Harris, first made its appearance in the United States in the northern portion of Vermont, and on the borders of Lower Canada, about the year 1828, though he adds in a foot-note that Mr. Jewitt states that "its first appearance in western Vermont occurred in 1820." From these places its ravages have gradually extended in various directions from year to year. In 1834 it appeared in Maine, which State it traversed in an easterly course at the rate of twenty or thirty miles a year. Dr. Fitch, the able entomologist to the New York State Agricultural Society, in his sixth report on the "noxious and other insects of the State of New York," gives a most interesting and instructive account of the habits and ravages of this the greatest of all the pests which has infested the wheat-crop. He thinks that this insect was originally brought from Great Britain to Quebec when lying in its larvæ state in some unthrashed wheat, and that it extended itself from thence along the St. Lawrence and Chambly (Sorel) rivers, and thus reached Vermont. All accounts agree in representing it as having overspread the surrounding country from the northwestern portion of Vermont.

In Washington county, New York, the larvæ, or little yellow worms of this insect, were found in the wheat in 1830, and in 1832 they had so multiplied as to completely destroy the crop in many fields. Previous to the arrival of this insect a considerable quantity of wheat was annually sent to market from that county, but at no time since (1860) has it been able to grow more than a small fraction of the amount needed for its own consumption.

Two years later the midge was progressing on its way south, through the adjoining counties of Rensselaer and Saratoga, devastating the wheat-fields in the same manner as in Washington county.

In 1834, the midge having advanced eastward across Vermont and New Hampshire, began to show itself in the State of Maine; and in the opposite direction it had become so numerous around Montreal as to seriously injure the crop.

In 1835 and 1836, over all the territory to which it had extended, and where wheat continued to be sown, it was so extremely destructive that further attempts to cultivate this grain were abandoned.

In 1849 and 1850, the midge having advanced up the St. Lawrence river to Lake Ontario, made its appearance in the counties along the north side of the lake, in Canada, travelling westward, it is said, at the rate of about nine miles each year. At the same time it was making similar progress on the opposite side of the lake, into the great grain-growing district of western New York, which it seems also to have approached at the same time from the Mohawk valley and central New York. It was quite injurious on the borders of Seneca lake in 1849 and 1850.

The late General James S. Wadsworth, of Genesee, New York, states that the midge was seen in the Genesee valley in 1854, more in 1855, and in 1856 it destroyed from one-half to two-thirds of the crop on the uplands, and nearly all on the flats. In 1857 it was still worse, taking over two-thirds of the crop.

The secretary of the New York State Agricultural Society, from statistics gathered for the year 1854, concluded that at the lowest estimate the injury done the wheat-crop in that year in the State of New York exceeded fifteen millions of dollars; or, if estimated at the price to which wheat afterwards advanced, to over twenty millions of dollars.

In Pennsylvania the midge seems to have attracted the attention of wheat-growers earlier than in western New York. In the Patent Office report for 1852, James Thornton, jr., of Byberry, Philadelphia county, Pennsylvania, says: "Mediterranean wheat is universally sown, its early maturity being proof against the grain-worm, (a very destructive insect that feeds upon the grain whilst in a milky state.)" And in the Patent Office report for 1853, Mr. F. J. Cope, of Hemphill, Westmoreland county, Pennsylvania, under date of November 8, 1852, says: "The wheat crop of this section was materially injured the past season by an insect not inaptly called the 'milk weevil,' from the fact that its depredations are committed on the growing crop while the grain is in the milky state. The injury has been almost entirely confined to the 'white' varieties, the Mediterranean escaping altogether. The grub (frequently four and five to each grain) is of an orange color, about one-eighth of an inch long. My entire crop was destroyed by it. There seems to be no remedy for it; and we must avoid risks by abandoning, at least for a while, those varieties which seem to be its special favorites."

There can be no doubt whatever that the insect alluded to is the midge. Since that time it has been but too well known to the wheat-growers of Pennsylvania.

The injury done the wheat-crop by this insect, is of itself sufficient to account for the diminution in the yield. The damage was greater in New York than in Pennsylvania, and the falling off in the crop from 1850 to 1860 is also greater in the former State than in the latter. In Pennsylvania the amount of wheat in 1850 was 15,367,691 bushels, and in 1860, 13,045,231 bushels, or a decrease of about fifteen per cent.; while in New York, in the same period, the decrease was from 13,121,498 bushels in 1850, to 8,681,100 in 1860, a decrease of about forty-four per cent.

In the other middle States, New Jersey, Delaware, and Maryland, the production of wheat was greater in 1860 than in 1850.

In these States the midge has done very little injury, owing, it is thought, to the warmer climate. The great deficiency in the production of wheat in the middle States lies wholly with New York and Pennsylvania, and is due principally to the advent of the wheat-midge since the census of 1850 was taken. It is believed that the midge is not now as destructive as it was in 1859, to the production of which year the census returns apply. The wheat crop of the following year (1860) was comparatively uninjured by the midge, and had the census been taken in that year, the deficiency would not have appeared as great as it now stands. When the midge appears among the wheat in a given section, it does comparatively small damage the first year, and consequently attracts little attention. The second year it spreads rapidly, and the third and fourth years, if the season is favorable to its operations, it destroys a large portion of the crop; wheat-growers become alarmed, and after a few futile attempts to raise wheat, are so discouraged as to abandon, in a good degree, all efforts to grow it. This was especially the case in western New York. In the county of Monroe, which in 1845 raised more wheat than any other county in the State, and more than all the New England States, the midge proved so

destructive in 1855 and 1856, that the members of agricultural societies held meetings to discuss the propriety of abandoning wheat culture. Spring crops and winter barley took the place of wheat, and many farmers who formerly produced a large quantity of wheat, raised little more than enough for their own consumption. There can be no doubt that farmers in this justly celebrated wheat section had been in the habit of sowing too much of their land to this grain. It was not uncommon to grow wheat every other year on the same land. The result was, as might have been foreseen, the land soon lost its primitive fertility, and became comparatively impoverished. Large crops of clover were grown by the aid of gypsum, (sulphate of lime,) and ploughed under as a manure for the wheat crop, and this in a measure restored the fertility of the soil. There can be little doubt, however, that ploughing under such large crops of clover for so many years increased to a deleterious degree the amount of carbonaceous matter in the soil, and this, as is well known, has a tendency to retard the ripening of the crop, as well as to increase to an injurious extent the growth of straw.

When the midge made its appearance, it found everything in the most favorable condition for its rapid propagation. The wheat-growers were entirely unprepared for such an enemy, and it swept through the country like an epidemic.

No wonder there was a wide-spread conviction that wheat culture must be abandoned. They knew little of the habits of this minute insect, and were unable to offer it any resistance.

The midge was, however, no new thing. It had been known in England for a century, and had at different periods proved very destructive. Farmers there, however, did not abandon wheat culture, neither will they do so in this country. They can, with proper care, raise wheat even in seasons when the midge would otherwise prove most destructive.

*How are the ravages of the midge to be avoided?* The means necessary to avoid the ravages of the wheat-midge are in themselves very simple, and yet they embrace every process of our agriculture.

Wheat is the most profitable of all our ordinary crops, provided the land and climate are suitable, and the yield good.

It should be the aim of the wheat-grower so to conduct all his operations that they shall tend to enrich and prepare his land for the production of the crop. His system of rotation, of feeding stock, and manuring, should have primary reference to this grain. The great error in American agriculture has been the seeding of too much land in wheat, the result of which practice is seen in small and diminishing crops. The time has come when we can no longer sow wheat on the same land every other year with success.

The wheat-grower will appreciate the necessity of introducing other crops for the purpose of preparing and enriching his land, and on fewer acres, to obtain a greater product.

The two substances most likely to be deficient in the majority of soils for the growth of wheat are ammonia and phosphoric acid.

From the fact that about one-half of the ash of wheat, barley, oats, rye, and Indian corn consists of phosphoric acid, it is usual to speak of the cereals as particularly exhaustive of the phosphoric acid in the soil; and it is undoubtedly true that the growth and exportation of cereals from the farm tend very materially to impoverish the soil of phosphoric acid. But it does not follow from this, *that when a soil falls off in its capacity to produce the cereals, it is owing, necessarily, to a deficiency of phosphoric acid.* We believe, in fact, that, with the exception, perhaps, of some portions of the grain-growing districts of the south, this is seldom the case. It has been clearly proved that a soil requires more available phosphoric acid to produce an average crop of turnips than to produce an average crop of wheat. The same, it is believed, is true of clover, beans, peas, vetches, and probably other leguminous plants. So that it follows, that so long as a soil produces good crops of clover, or peas, or beans, there is no deficiency of phosphoric acid in the soil, so far, at least, as the production of the cereals is concerned.

When by a continued course of cropping with the cereals the phosphoric acid becomes deficient—not exhausted—the crops of clover and other leguminous plants will first fall off; and if the farmer, after this, goes on impoverishing his soil by sowing the cereals, he must be content to do it with very

poor results. Nature protects herself, and the farmer's capital will be exhausted long before he has so exhausted the soil of phosphoric acid, that a good farmer might not render the same soil highly productive, and that, too, without the application of a single atom of phosphoric acid.

It is true that it is often the cheaper method of renovating such soils by the direct purchase of bones, guanos, or other manures which contain large quantities of phosphoric acid; or, what is sometimes cheaper still, by the purchase and consumption of oil-cake, cotton-seed cake, &c. *As long as we can obtain good crops of clover, we need not apprehend any deficiency of phosphoric acid.* Under such circumstances there is little hope that an application of phosphoric acid to any of the cereals would be attended with any great benefit.

Now, all agree that phosphoric acid is more likely to be deficient than any other ash-constituent of plants; and if the above argument is correct—and it is sustained by many well-known facts—it follows that, in the majority of cases, there is no necessity for the direct application of mineral manures to the cereals. *But the cereals need manure of some kind*, the average yield being not half what it should be.

We have shown that so long as we can grow good crops of clover, the soil contains in an available condition a sufficient quantity of *mineral* plant-food for the production of the largest crops of wheat. We do not, therefore, need a direct application of mineral manures. But we need manure of some kind. We must, therefore, look among the organic manures for the particular ingredient which is required.

Organic manures are divided into two classes, carbonaceous and nitrogenous. It must therefore be a carbonaceous or a nitrogenous manure, or both, that we need to enrich our land for wheat and other cereals.

It might easily be shown that we do not need carbonaceous matter for the growth of wheat. On soils, as we shall presently show, where we have been in the habit of ploughing in clover, there can be little doubt that carbonaceous matter is in excess; and on all soils, if it was carbonaceous matter that was needed, nothing would be easier than to supply it in abundance, and at a cheap rate. If it is not carbonaceous matter that we need, it *must be nitrogenous matter*.

Organized nitrogen in decaying ultimately forms ammonia, and it is in this state, or as nitric acid, that it is generally taken up by plants. In speaking of nitrogenous matter, therefore, it will be more convenient to speak of it as ammonia. In enriching the soil for wheat and other cereals, the main object should be to get ammonia.

We know of no system of culture, or of manuring for the cereals, which experience proves beneficial, that does not, either directly or indirectly, furnish ammonia to the soil, either by eliminating it from the organic matter in the soil, or by increasing the capacity of the soil for abstracting it from the air, or dews, or rain, or by growing those plants which have this power, or by the direct application of ammonia in manure. We cannot increase the growth of the cereals without increasing in some way the supply of ammonia. We are well aware that neither the cereals nor other plants will grow unless the soil contains all their ash-constituents in sufficient quantity and in available condition. But there is no practicable and economical method of supplying the requisite quantity of ammonia which does not, at the same time, furnish these ash-constituents in quantity fully equal to the demand of the increased growth of the cereals caused by the application of the ammonia.

This assertion is based on the experiments of Messrs. Lawes and Gilbert, confirmed as they are by the experience of practical farmers.

Mr. Lawes has devoted a large part of his home-farm at Rothamsted, England, for the last twenty-two years to experimental purposes. One field of fifteen acres has been devoted to experiments of different fertilizing substances on wheat—wheat having been annually sown on the same land for over twenty years. Another field has been devoted in the same way to experiments on turnips; another to experiments on peas, beans, and tares; another to experiments on clover, and another to experiments on barley alone, and in rotation with other crops. On the wheat-field it was found that none of the manures used increased the yield of wheat to any material extent, unless they contained ammonia. Potash, soda, superphosphate of lime, magnesia, the ash of fifteen tons of barn-yard manure, the ash of

wheat-straw, alkaline silicates—in short, none of the ash-constituents of plants had any effect. But wherever ammonia was used there was obtained an increased yield, and, within certain limits, the increase of wheat was in proportion to the quantity of ammonia supplied.

But here a new and important fact was brought to light. Though the increase of wheat was in proportion to the quantity of ammonia supplied, in no single case out of many hundreds of experiments which have been made during the last twenty years, was as much ammonia (or, rather, nitrogen) obtained in the increase of the wheat and straw as was furnished to the soil in manure.

*There was evidently a loss of ammonia by the growth of wheat.* Professor Way has advanced the hypothesis that the large quantity of silica found in the straw of wheat and other grains is taken up by the roots of the plants as an ammonia-silicate—the silica being deposited on the straw, and the ammonia evaporated into the atmosphere. This may or may not be the true explanation; but that there is, *practically*, a great loss of ammonia by the growth of wheat there can be no doubt. The same, it is believed, is true of barley, oats, rye, and Indian corn, as well as of herds-grass, rep-top, rye-grass, and other grasses grown for fodder. We rest this belief on the indications of experiments, and on the experience of practical farmers, and not on Way's hypothesis in regard to the absorption of silica as an ammonia-silicate.

But if that hypothesis is correct, it follows, as a matter of course, that the plants we have named, and all others having silicious stems and stalks, belong to this class, and their growth involves a great loss of ammonia to the farm.

On the other hand, Mr. Lawes's experiments on clover, beans, peas, and tares, indicate that there is no loss of ammonia during the growth of these plants. If we apply fifty pounds of ammonia to a crop of wheat, (which is equal to three hundred weight of the best Peruvian guano,) the increased growth of the wheat and straw will not give us back more than twenty or twenty-five pounds of ammonia; the remaining twenty-five or thirty pounds has been evaporated into the atmosphere. If, on the other hand, we apply fifty pounds of ammonia to clover or other leguminous plants, or to turnips, it is all, or nearly all, retained. There is little or no loss.

Ammonia, or nitrogen, exists in all soils, but usually in a condition unavailable to plants except in small quantity. If it existed in an available condition, it would long ago have been washed away; but it lies there inert and insoluble. *It is rendered active and available by tillage.* Hence the advantages of summer fallows on clay soils. Such soils frequently abound in nitrogen and other elements of plants, but they are in an insoluble condition. The soil is so compact that light, heat and air—the three grand agents of decomposition—are excluded, and it is only by tillage—by stirring the soil, by exposing it to the sun, and letting in the air—that these inert substances can be rendered available as food for plants.

On light and sandy soils, which admit the air more readily, there is not that accumulation of organic matter and other food of plants which exists in the clays, and consequently more tillage is not so beneficial.

Ammonia and nitric acid (which probably has the same effect as ammonia) exist in the atmosphere. A well-pulverized soil, especially of a somewhat clayey nature, attracts ammonia from the air and retains it. And here we may allude to one of the most important discoveries which have been made in scientific agriculture during the past ten years. Professor Way, at the time chemist to the Royal Agricultural Society of England, made a series of investigations on what has since been called the "absorptive powers of soils," which resulted in throwing new light on the processes of vegetable nutrition, and opening up a new field for future investigations, which have since been made, in regard to the manner in which plants take up food from the soil through their roots. In the course of these investigations he found that ordinary soils possessed the power of separating from solution in water the different earthy and alkaline substances presented to them in manure. Thus, when solutions of salts of ammonia, of potash, magnesia, &c., were made to filter slowly through a bed of dry soil five or six inches deep, arranged in some suitable vessel, it was observed that the liquid which ran through no

longer contained any of the ammonia or other salt employed. The soil had, in some form or other, retained the alkaline substance, while the water in which it was previously dissolved passed through.

Further, this power of the soil was found not to extend to the whole salt of ammonia or potash, but only to the alkali itself. If, for instance, sulphate of ammonia was the compound used in the experiments, the ammonia would be removed from solution, but the filtered liquid would contain sulphuric acid in abundance, not in the free or uncombined form, but united to lime; instead of sulphate of ammonia, we should find sulphate of lime in the solution; and this result was obtained, whatever the acid or the salt experimented upon might be. It was found, moreover, that the process of filtration was by no means necessary; by the mere mixing of an alkaline solution with a proper quantity of soil, as by shaking them together in a bottle, and allowing the soil to subside, the same result was obtained. The action, therefore, was in no way referable to any physical law brought into operation by the process of filtration.

It was also found that the combination between the soil and the alkaline substance was rapid, if not instantaneous, partaking, therefore, of the nature of the ordinary union between an acid and an alkali.

In the course of these experiments several different soils were operated upon, and it was found that all soils capable of profitable cultivation possessed the property in question in a greater or less degree. Pure sand, it was found, did not possess this property. The organic matter of the soil, it was proved, had nothing to do with it. The addition of carbonate of lime to a soil did not increase its absorptive power, and, indeed, it was found that a soil in which carbonate of lime did not exist possessed in a high degree the power of removing ammonia or potash from solution.

To what, then, is the power of soils to arrest ammonia, potash, magnesia, phosphoric acid, &c., owing? The above experiments lead to the conclusion that it is due to the clay which they contain. In the language of Professor Way, however, "It still remained to be considered, whether the whole clay took any active part in these changes, or whether there existed in clay some chemical compound in small quantity to which the action was due. This question was to be decided by the extent to which clay was able to unite with ammonia or other alkaline basis, and it soon became evident that the idea of the clay, as a whole, being the cause of the absorptive property was inconsistent with all the ascertained laws of chemical combination."

After a series of experiments, Professor Way came to the conclusion that there is in clays a peculiar class of double silicates to which the absorptive properties of soils are due. He found that the double silicate of alumina and lime, or soda, whether found naturally in soils or produced artificially, would be decomposed when a salt of ammonia, or potash, &c., was mixed with it, the ammonia or potash taking the place of the lime or soda. Professor Way's "discovery," then, is, not that soils have "absorptive properties" that have long been known, but that they absorb ammonia, potash, phosphoric acid, &c., by virtue of the double silicate of alumina and soda, or lime, &c., which they contain.

Soils are also found to have the power of absorbing ammonia, or rather carbonate of ammonia, from the air.

"It has long been known," says Professor Way, "that soils acquire fertility by exposure to the influence of the atmosphere, hence one of the uses of fallows. \* \* \* I find that clay is so greedy of ammonia, that if air charged with carbonate of ammonia, so as to be highly pungent, is passed through a tube filled with small fragments of dry clay, *every particle of gas is arrested.*"

This power of the soil to absorb ammonia is also due to the double silicates. But there is this remarkable difference, that while either the lime, soda, or potash silicate is capable of removing the ammonia from solution, the lime silicate alone has the power of absorbing it from the air.

We have not the space to enter into the details of these investigations, or to point out their bearing on practical agriculture. Suffice it to say that a well-cultivated soil has the power of absorbing from the atmosphere a considerable quantity of ammonia. We will suppose that the soil, by the decomposition of its organic matter, and its power of attracting ammonia from the atmosphere, and from rain and dew, receives annually fifty pounds of ammonia. If we grow a crop of wheat, barley, oats, rye, or Indian corn, from twenty to thirty pounds of this ammonia is evaporated into the atmosphere during the growth

of the plants, and is lost to the farm. If, on the other hand, we grow clover, beans, peas, tares, or turnips, the whole of this fifty pounds is organized in the crop, provided there is sufficient available mineral matter in the soil; and if the crop is ploughed under, or consumed by animals on the farm, the whole fifty pounds of ammonia, or nearly so, will be retained for the use of the subsequent cereal crops.

We have not space to dwell on this important difference in the two classes of plants here designated, one of which (clover, &c.,) retains all the ammonia received from the soil and the atmosphere, while the other class (the cereals) dissipate it into the atmosphere during their growth. A correct application of this fact forms the key to good farming.

We must grow more green crops and a less breadth of cereals.

M. Leonce de Lavergne, an eminent French writer, in his work on the Rural Economy of England, Scotland, and Ireland, deduces the same law from his observations of the astonishing results of the English system of rotation, though without offering any satisfactory explanation of its *rationale*. Speaking of England, he says: "That small country, which is no larger than a fourth of France, alone produces one hundred and four millions of bushels of wheat, forty-eight millions of barley, and ninety millions of oats. If France produced in the same ratio, her yield would be four hundred millions of bushels of wheat, five hundred and sixty millions of bushels of barley, oats, and other grain, equal to at least *double* her present productions; and we ought to obtain more, considering the nature of our soil and climate, both much more favorable to cereals than the soil and climate of England. These facts verify this agricultural law, that, to reap largely of cereals, it is better to reduce than to extend the breadth of land sown, and that by giving the greatest space to the forage crops, not only is a greater quantity of butcher's meat, milk, and wool obtained, but a larger production of grain. France will achieve similar results when she has covered her immense fallows with root and forage crops, and reduced the breadth of her cereals by several millions of hectares."

This is true. English farmers, guided by close observation and experience, have slowly worked out an admirable system of rotation, and now scientific investigations have elucidated the principles upon which it is founded. We may not be able at present to pursue generally the same system of rotation in this country, but the *principles* are as applicable here as there, and, if adopted, will produce the same beneficial results.

The application of *plaster*, *ashes*, *superphosphate of lime*, and other mineral manures, has rarely any great effect on the growth of the cereals; but *superphosphate of lime* has an almost magical effect on turnips, and plaster usually increases the growth of clover, so that these mineral manures, when applied to these crops, may be rendered, indirectly, of great benefit to the cereals.

An English farmer once said to the writer, "Insure me a good crop of turnips, and I will insure you a good crop of barley, and of every other crop in the rotation." Of so much value do British farmers consider the turnip crop as a means of enriching the soil for the growth of the cereal grains, that they spend more money in preparing the soil for turnips than for any other crop, frequently fifty dollars per acre. The turnip crop has justly been termed the "sheet anchor" of British agriculture. It enables the farmer to keep an immense stock of sheep and cattle, and thus enrich the soil; the ammonia which turnips obtain from the soil, the rain, and the atmosphere being retained and left on the farm for the use of the following cereal crops. In the Norfolk or four-course system of rotation, one-fourth of the arable land is sown to turnips, followed by barley, seeded with clover. It then lies one or two years in clover, followed by wheat at one furrow. After the wheat, turnips again follow, and so on as before. Latterly, by the use of *superphosphate* and *guano* for turnips, and by feeding large quantities of oil-cake and other purchased cattle food, the land has become so rich that many farmers have thought it necessary to introduce an extra grain crop into the rotation, in order to reduce the soil. But hitherto the rule has been never to take two grain crops in succession.

How different from this is the practice of some of our American farmers! Corn, barley, and wheat often follow each other in succession; then seed down with timothy, red-top, or some other exhausting

grass ; take off all the hay and then renew the process. To call this a "rotation of crops" is absurd. We might as well grow a crop of Indian corn every year.

*We must alternate the cereals with crops of clover, peas, beans, tares, and other leguminous plants, or turnips ; feed them out on the farm, and carefully save and return the manure to the soil.*

In determining which crop to raise for feeding on the farm, we must not merely ask the simple question, "Which crop will afford the most nutritious matter?" but, "Which will ultimately be most profitable, taking into consideration the effect of its growth on the soil, its value as food, and the value of the manure made by its consumption on the farm?" All will admit that to grow wheat to be fed to animals for the purpose of enriching the farm as the primary object would be a wasteful practice, no matter how low a price it brought in market ; and to grow barley, oats, rye, and Indian corn for the same object is wasteful also, though perhaps in a less degree.

In order to enrich the soil for the growth of the cereals, therefore, we must grow those plants which do not dissipate ammonia. We must feed them on the farm to stock ; and if we use any grain, or purchased cattle food, it should be such, other things being equal, as contains the most nitrogen for the value of the manure ; the quantity of ammonia it contains will be in proportion to the richness of the food in nitrogen. Many farmers think manure is manure, no matter how it is produced. *If the elements which make rich manure are not in the food they will not be found in the manure, however carefully it is preserved or composted.*

Horses fed on herdsgrass and oats might do more work, but their droppings would not be as valuable as though they were fed on clover-hay and peas, for the reason that peas contain twice as much nitrogen as oats, and the clover much more than the herdsgrass.

In determining which food to use, both these facts must be taken into consideration. In regard to feeding sheep, however, there is no drawback to the use of clover. Sheep do better on clover-hay than on any other, and it would be the height of folly to grow herdsgrass, rye, grass, or red-top, or any of the natural grasses, for the purpose of feeding sheep. Clover impoverishes the soil less than the grasses ; it contains more nitrogen, is at least equally fattening, and makes richer manure. The same may be said of peas and beans, as compared to oats, barley, rye, or corn. They impoverish the soil less, contain twice as much nitrogen, are equally fattening when judiciously used, and afford much more valuable manure. The same is true of oil-cake. It is quite as fattening as corn, and makes far better manure.

Whatever we do in raising crops, in fattening stock or purchasing cattle foods, let our object be to accumulate ammonia for the growth of the cereals, and their yield will be soon greatly augmented.

To avoid the midge, it is essential to get wheat in early. To attain this result, the land must be naturally or artificially drained. This is the first requisite, without which all others will fail. The best of tillage, manures, culture, and seed will be of little avail if the soil requires under-draining.

Other things being equal, wheat will be at least ten days earlier on land that is thoroughly under-drained than on that which needs draining ; and it is a well-known fact, that if we could get our wheat into flower ten days earlier than usual we should avoid the midge.

Early sowing of late years has been very generally adopted as a means of getting wheat earlier ; but in sowing too early there is danger from the Hessian fly. This insect deposits its eggs in the young wheat in autumn, and early-sown wheat is more liable to injury than that which is sown later. In the wheat-growing section of New York the time for sowing winter wheat is from the first to the twentieth of September. Formerly it was sown as late as the twenty-fifth of September ; or, in some instances, as late as the first of October ; but, since the advent of the midge, such late sowing has been abandoned. If the land is in high condition and well drained, from the tenth to the twentieth of September is, perhaps, the best time to seed. Sown at this time, we stand a fair chance of steering between the two great pests of the wheat-grower. If we sow earlier, we run additional risk from the Hessian fly ; and if later, the midge will almost certainly destroy the crop.

The land being well drained, enriched, and properly prepared in good season, the next important point is the variety of wheat to sow. To avoid the midge, it must come into flower early. The variety

most extensively grown in New York and Pennsylvania since the advent of the midge is the Mediterranean. It is a red wheat, originally of inferior quality, but much improved of late years by sowing in good early-wheat soil. Of white wheat the Soules is most extensively grown. It is, with the exception of the Boughton wheat, one of the earliest white varieties yet generally introduced. The Boughton wheat is extensively grown in Maryland and Virginia. It is from two to three weeks earlier than the Soules, and has been introduced into New York in the hope that its early maturity will protect it from the midge. This subject of getting an early variety of white wheat is attracting much attention, and there can be little doubt we shall be able to obtain a variety that will be early enough to escape the midge.

*Wheat-growing in the west.*—The increased production of wheat in the western States in proportion to population has been most gratifying. Greatly as the means of transportation have increased, they have not kept pace with the increase in production. The navigation of the Mississippi becoming closed as a result of the present civil war, it was impossible to transport the large crops of the west to the Atlantic markets. Freight rose to such an extent that it cost more than *five times* as much to transport a bushel of wheat from Iowa to New York as the farmer received for it. The crops were sold at prices ruinous to the producer.

As the war continued, however, and as our western army advanced south, a demand for agricultural produce was created which gave buoyancy to prices, and at the present time (1864) the western farmer obtains nearly as much for his produce as the farmers of the middle States.

The effect on wheat, however, has been less marked than on oats, corn, hay, and other articles largely consumed by the army. The price of wheat is relatively lower than that of any other produce. So long as we continue to export wheat to Europe, the price will be regulated by the foreign markets, and the cost of sending it there. The bountiful wheat-harvest of 1863 in Great Britain and France, reduced prices so low that English farmers found wheat one of the cheapest grains they could feed to their stock. Had it not been for the high premium on gold, the price of wheat in this country, and especially at the west, would have been less than the cost of production; as it is, the advance in gold has served to increase prices in the west much more in proportion than in the eastern and middle States. For instance, if a bushel of American wheat sells at \$1 25 in London, and the cost of sending it from Iowa is \$1, the Iowa farmer, with gold at par, receives only twenty-five cents a bushel for the wheat.

Should gold continue at \$2 50, (the price at the present writing,) though the wheat still brings only \$1 25 per bushel in London, and the cost of sending it there should be \$1 a bushel, as before, the Iowa farmer would receive \$2 12 per bushel for his wheat, instead of twenty-five cents, as would be the case if gold was at par. The wheat is sold for gold, and \$1 25 in gold sells for \$3 12 in legal money. Deduct \$1 as the expense of sending it to London, and we have \$2 12 as the price which wheat should bring in Iowa. In other words, the premium on gold increases the price of wheat in Iowa *eight-fold*.

On the same basis, the farmer in New York, whose wheat costs only twenty-five cents a bushel to ship to London, would receive, with gold at par, \$1 a bushel; and with gold at \$2 50, as before, he would receive \$2 87.

The premium on gold, which advances the price of wheat eight-fold in Iowa, increases it less than three-fold in New York. In other words, the *increase* in the price of wheat caused by the premium on gold is more than twice as great in the west as in the eastern and middle States.

These figures are not intended to represent the actual cost of sending wheat to Europe, but are used merely to illustrate the effect on prices of the present premium on gold. There can be no doubt that the western farmer obtains a relatively higher price for his produce, owing to the premium on gold, than the eastern farmer.

Of course any conclusions based on the present anomalous condition of affairs will be unsatisfactory. When we return to a specie basis, it would seem that the present high prices of produce in the west, being caused by the premium on gold, must rapidly fall.

For some time before the war our western farmers were beginning to complain that wheat-growing was not profitable—that the cost of transportation left them barely enough to meet the cost of production—and it was argued wisely, as we think, that it would be more profitable to grow less wheat, and raise more cattle, pork, wool, &c., the cost of transporting which, in proportion to value, is much less than that of a more bulky produce.

When things return to their natural channel, there can be little doubt that the west will find it more profitable to produce meat and wool, than to grow wheat. It was so for some years previous to the war, and will be so again when the war ends.

In the mean time the demand for wheat and other grain, induced partly by the increased consumption caused by the war, and the decreased production caused by the abstraction of labor employed in the mechanic arts and the military service, will for some years, probably, keep prices high enough to make wheat-growing at the west exceedingly profitable. The time must be expected, however, when the western farmer will again find the cost of sending wheat to the eastern cities and to Europe, so high as to leave him barely margin enough to pay the cost of production.

The western farmer for a year or two has been receiving high prices for his produce. He would do well fully to understand the causes which have led to this result. They are by no means permanent, and as long as we continue to export breadstuffs to Europe, and prices remain there as they are at present, nothing but a high premium on gold would enable us to command high prices for breadstuffs. When we return to specie payments, if we have a large surplus of wheat to export, it is vain to expect, as a general rule, anything like present prices in the west.

The rapidity with which manufactures have increased in the west, as well as at the east, render it highly probable that in future there will be a much greater home demand for agricultural products of all kinds, than existed for a few years previous to the war. Some of the largest coal-fields in the world exist in the western States, while iron and other metals are found there in great abundance. Everything is favorable for building up a great manufacturing interest. Whatever may be the result of the war in other respects, it seems certain that the price of manufactured articles must also continue high. The interest on our national debt, and the increased yearly expenses of the government, will require heavy duties on foreign manufactures; and this, in addition to the heavy expenses of transportation, will give the manufacturers in the west all the protection that can be desired. The discovery and development of the immense mineral resources of our western Territories, and their astonishing richness in gold, silver, and other metals, also favor the idea that in a few years the centre of population will be found in the west, whither it has been marching with steady progress, rather than in the Atlantic States. Most of the produce which is now sent east at such a great expense will be consumed at home, and the farmers of the interior will thus obtain a more equable market at fair remunerative prices.

There is, perhaps, no one fact which gives a clearer idea of the great growth of the west, and the increase of its products, than the amount of grain which is shipped each year from Chicago. In 1838 seventy-eight bushels of wheat comprised the total exports from what has since become the greatest grain market in the world. In 1839 it was 3,678 bushels; in 1840, 10,000 bushels; in 1841, 40,000 bushels; in 1842, 586,907 bushels; in 1845 it first reached a million bushels; in 1847 over 2,000,000 bushels. In 1851 and 1852 it again fell off to less than a million bushels; but in 1853 again rose to 1,680,998 bushels. In 1854 it was 2,744,860 bushels. In 1855, 7,110,270 bushels; in 1856, 9,419,365 bushels; in 1857, 10,783,292 bushels; in 1858, 10,759,359 bushels; in 1860, 16,054,379 bushels; in 1861, 22,913,830 bushels; in 1862, 22,902,765 bushels; and in 1863, 17,925,336 bushels of wheat.

Our official tables show that there were 173,104,924 bushels of wheat raised in the United States in the year 1859. In that year we exported to Great Britain only 295,248 bushels of wheat. In other words, out of every thousand bushels produced, we exported to Great Britain less than one and three-fourths bushels. In 1860 our exports of wheat amounted to 11,995,080 bushels, or, assuming that

no more was raised that year than in 1859, over seventy bushels in each one thousand produced. In 1861 and 1862 the exports were even still greater—greater by far than ever before known, being 20,061,952 and 29,798,160 respectively—falling down in 1863 to 16,069,664. The closing of the Mississippi, and the loss of the southern trade, caused by the rebellion, together with the comparative failure of the wheat crop in Great Britain, accounts for this large increase in our foreign exports.

There can be no doubt that the west, directly or indirectly, is the source of all the wheat that is exported from the United States, and this in addition to supplying New England with breadstuffs. Under these circumstances, or such as are likely to exist, shall we continue to export wheat?

This question has been raised both in Europe and in this country. The question is not whether the western States can raise more than enough for home consumption. There can be no doubt on this point. But New England and the middle States are increasing in population, while their production of wheat is declining. Can the west supply this increased demand and growing deficiency of the New England and middle States, besides supplying the rapidly increasing home demand, and have a surplus left to export to foreign countries? Had the country continued united and prosperous, had the west continued to develop her rich agricultural resources with the rapidity of the last ten years, there can be little doubt that we should have continued for a considerable time at least to export wheat; but, with the increased demand caused by the war, with the abstraction of labor from agricultural pursuits, and the stimulus given to manufactures, it is a question not so easily answered, whether we shall, for a few years to come, continue to produce a surplus. Much depends on the middle States, to the productiveness whereof very slight improvement in our system of agriculture would add greatly.

There is no reason why the middle States should not raise wheat as abundantly as in past years. While the aggregate production of wheat has greatly decreased, there are farmers in every county who, by a judicious system of cultivation, raise as much wheat as at any former period. Let this improved system of farming become general, and the middle States would soon become large exporters of wheat, unless the stimulus given to manufactures shall greatly increase the home demand. Farmers are now receiving better prices for their produce than at any former period, and this is favorable to the introduction of improved systems of cultivation. With prices as low as they have ruled from 1850 to 1860, it was not clear whether farmers in the middle States could afford to underdrain, manure, and cultivate their land to that extent which is necessary for the production of large crops. This has been done in individual cases with much profit, but still the great majority of farmers could not see their way clear in expending so much capital, and, indeed, it must be confessed that it is not easy to show how *high farming* can be made profitable with low prices. All this for the present, however, is now changed. Prices have increased to a figure never before reached in this country. Everything that the farmer can raise, is in demand at rates which are highly remunerative. This demand and high prices cannot fail to stimulate farmers to put forth every energy to increase their crops. A higher system of culture will be introduced, and, when once adopted and found profitable, will be continued, even though prices should fall to the old standard.

There can be little doubt that the war is destined to make great changes in our agriculture. Farming never was so remunerative as at the present time. Hitherto, while the profits have been generally steady and sure, they have not been large, and the best talent of the country found greater attraction in other pursuits.

As a people we have been distinguished for our material prosperity. "Labor is wealth," and this has poured in upon us from every country in Europe. This labor, directed by men of superior education and enterprise, has developed the vast resources of the country to an extent without a parallel in history. We had enjoyed a long period of peace. The expenses of the government were but little, people were active, industrious, intelligent, and enterprising. No wonder we became wealthy. But did our gains favor agricultural improvement? We think not, materially. Being rich, with none of those social distinctions which in Europe are kept up at such great cost, our wealth has been expended in luxuries. The result was, that those who contributed to our pleasures and the gratification of our

tastes were more in demand and received a higher compensation than those who furnished the mere necessities of life. The war will, in the end, make us poorer and more economical, and the time must sooner or later arrive when we shall have less to spend in mere luxuries; and those who furnish the necessities of life will receive a higher consideration and better compensation. The importance of agriculture will be realized, and will attract the best minds of the country, and vast improvements rapidly follow, succeeded by enlarged production. This great change, however, will not be brought about at once. It will require time to introduce an improved system of agriculture and to materially increase the productiveness of our farms.

In the mean time, it is highly probable that our exportation of breadstuffs to Europe will be materially lessened, unless a European war should greatly enhance prices. It is, however, to an increased home consumption that we look for those higher prices that will give that stimulus to American agriculture it has hitherto needed. As long as we continue to export wheat, no matter to how small an extent, the price in Europe will regulate the price in this country.

The price obtained in England for the 295,241 bushels of wheat which we exported in 1859 determined the price of our whole crop of over 173,000,000 of bushels raised that year. The price of the one and three-fourths bushel exported fixed the price of the thousand bushels consumed at home. If, for a few years, the price of grain in this country is determined not by what it will bring when shipped to Europe, but by the price at which Europe can furnish it to us here, and if we are compelled to forego some of the European luxuries which have of late years absorbed such a large proportion of our wealth, it will be no great misfortune to us as a people.

For the following remarks on wheat culture in California we are indebted to ex-Governor Downey to whom we are under great obligations for other important statements:

"Thus far in our history the wheat crop is next in importance to our product of the precious metals; yielding an abundant supply for home consumption, and a large surplus for exportation. All of our valleys north of the Salinas plains, in Monterey county, are admirably adapted to the production of this great staple, yielding from 30 to 60 bushels to the acre, and generally exempt from all diseases that affect and annoy the farmer in the Atlantic and Mississippi States. Our virgin soil as yet requires neither fallowing nor manuring, but year after year yields from the same field its heaps of golden grain. From the bay of Monterey to the head of Russian river, an extent of 250 miles, is one vast wheat field. Barley and oats are produced in great abundance, but their export demand is limited. The wild oats, which is fully as luxuriant as the cultivated, is one of our most important grasses, and, cut while the grain is in its lactescent condition, is considered the best hay in the world. From the 10th of May until the 1st of November the farmer expects no rain. He therefore cuts, threshes, and sacks on the same field, and houses in a sound and perfect condition, rendering it perfectly safe for the mill or the longest voyage."

#### THE QUALITY OF OUR WHEAT.

High quality in wheat can only be obtained where there is sufficient heat in summer for its perfect elaboration. There is nothing that will take the place of sunshine. In this respect the climate of the United States is far better for the production of wheat of high quality, than that of Great Britain.

The best wheat years in England are the driest and hottest. The year 1863, with its great heat, was the best wheat season ever known in England. The crop was never before so large, or the quality so good. The heat of the summer months approximated closely to that of this country. With "high farming" there is nothing which the English wheat-grower dreads so much as a cold, moist summer. Could he be always sure of an American summer he could calculate on obtaining an average yield of not less than forty bushels per acre, and of the highest quality. But should he make his land rich enough to produce a heavy crop in a dry season, and a cool, moist summer should ensue, his wheat would be all laid and not yield half a crop. So far as the summer climate is concerned, therefore, the American wheat-grower has everything that he can desire. Ours is the climate for "high farming."

The severity of the winters, and cold, late, wet springs, followed suddenly by dry, hot summers, are the chief drawbacks to our American climate; but their injurious effects can easily be guarded against. All that we need is *good farming*. The land must be drained, well cultivated, properly enriched, and sown with a variety that matures early, and the result will be all that can be desired. In moist lands,

especially, the roots of grain which are not well protected by a healthy growth in autumn are very sure, by the upheaving of the ground, to be broken and exposed to a killing cold in winter. This is inevitable in long-cultivated and moist lands. In new soils, rendered light and porous by the remains of vegetable matter, late sowing often results differently. Underdraining will lengthen the season at least two weeks in autumn and spring. The land will be drier and warmer in spring and fall, and cooler and more moist during the summer months. The wheat, on thoroughly underdrained, well-cultivated, and enriched land, will make a strong, healthy growth in autumn, and thus be enabled to protect itself against the rigors of our severest winters; while it will come forward rapidly during the cool spring months, and by the time that dry, hot weather sets in the plants will be so far advanced, and so full of sap, that all that is needed is for the crop to mature. It is at this point that we need sufficient sunshine to elaborate the juices of the plant and give us heat of high quality; and it is just here that the American climate is so far superior to that of Great Britain. It is seldom, indeed, that we have not sun enough to mature the heaviest crops when the soil and culture are adapted to the wheat plant.

While it is true that the American farmer is highly favored in regard to climate, it must be acknowledged that the average quality of our wheat is by no means what it should be. In New York, Pennsylvania, and Ohio, the midge has driven out of cultivation some of the best varieties of white wheat, and their place has been occupied by the red Mediterranean wheat, which, though earlier, is of inferior quality. The means which we have recommended to avoid the midge, would enable us to grow better varieties, as well as to improve their quality.

In the western States the quality of the wheat has greatly improved; but yet it is by no means what it should be. More care in cleaning the seed, better cultivation, and less slovenly harvesting, threshing, and cleaning, would add greatly to the quality of the western wheat crop, as well as to the profits of the grower. The census returns do not show, separately, the amount of winter and spring wheat. In many sections of the west, spring wheat is now much more extensively grown than winter wheat, and the quality is, of course, inferior to the best samples of the latter. Much can be done, and is doing, to improve the quality of our spring wheat, but the same efforts would give us winter wheat of much greater excellence. With a better system of cultivation at the west, winter wheat will take the place of the spring variety.

In concluding this article, it may not be out of place to suggest, that if any persons should be disposed, from what we have written respecting the consumption of wheat, to draw parallels with the individual consumption in other countries, they should not overlook the extensive use made of maize (Indian corn) by some portions of our people with whom wheat is a secondary consideration as an article of diet.

## INTRODUCTION.

## INDIAN CORN.

*Bushels of Indian corn produced in 1860.*

The production of Indian corn in the United States and Territories, according to the census of 1860, was 838,792,740 bushels. It is difficult to fully realize the magnitude of these figures, which we can only appreciate by contemplating them in connexion with the aggregate production of our other great staples. With this object, we here introduce a table showing the production of wheat, rye, oats, barley, buckwheat, peas and beans, in 1850 and in 1860, as compared with the production of Indian corn.

*Wheat, rye, oats, barley, buckwheat, peas and beans, raised in the United States and Territories in 1850 and 1860, as compared with Indian corn.*

	1850.		1860.	
Wheat.....	100,485,944	bushels.	173,104,924	bushels.
Rye.....	14,188,813	"	21,101,380	"
Oats.....	146,584,179	"	172,643,185	"
Barley.....	5,167,015	"	15,825,898	"
Buckwheat.....	8,956,912	"	17,571,818	"
Peas and beans.....	9,219,901	"	15,061,995	"
Total.....	284,602,764	"	415,309,200	"
Indian corn.....	592,071,104	"	838,792,740	"

It will be seen from the above table that we raise nearly five bushels of Indian corn to one of wheat, and more than *double the aggregate* production of wheat, rye, oats, barley, buckwheat, peas, and beans. Such was also the case in 1850. It will be seen, however, that less wheat was raised in 1850 *in proportion to Indian corn* than in 1860. In other words, vastly as the production of Indian corn has increased in ten years, the production of wheat has increased in still greater proportion.

We produce more bushels of oats than of wheat, but in proportion to Indian corn the increase is not as great in 1860, as compared with 1850, as in the case of wheat.

The production of no other grain has increased so much in the last ten years as barley. It will be seen that we produce *three* times as much in 1860 as in 1850, while the production of Indian corn has not quite doubled.

Buckwheat, peas, and beans have also greatly increased, but only a fraction more than Indian corn.

The principal corn-growing States are: Illinois, Missouri, Ohio, Indiana, Kentucky, Tennessee, Iowa, Virginia, Alabama, Georgia, North Carolina, Mississippi, Pennsylvania, and New York.

The following table shows the production of Indian corn in these States in 1860, 1850, and 1840.

*Production of Indian corn in the principal corn-growing States in 1860, 1850, and 1840.*

States.	1860.	1850.	1840.
Illinois .....	115, 174, 777	57, 646, 984	23, 634, 211
Missouri .....	72, 892, 157	36, 214, 537	17, 332, 524
Ohio .....	73, 543, 100	59, 078, 695	33, 668, 144
Indiana .....	71, 588, 919	52, 964, 363	28, 155, 887
Kentucky .....	64, 043, 633	58, 072, 591	30, 847, 120

Iowa .....	42, 410, 686	8, 656, 799	1, 406, 241
Virginia .....	38, 319, 999	35, 254, 319	34, 577, 591
Alabama .....	33, 226, 282	28, 754, 048	20, 947, 004
Georgia .....	30, 776, 293	30, 080, 099	20, 905, 122
North Carolina .....	30, 078, 564	27, 941, 051	23, 893, 763
Mississippi .....	29, 057, 682	22, 440, 562	13, 161, 237
Pennsylvania .....	28, 196, 821	19, 835, 214	14, 240, 022
New York .....	20, 061, 049	17, 553, 400	10, 972, 286

Tennessee was the greatest corn-producing State in 1840, Ohio in 1850, and Illinois in 1860.

Kentucky was the second greatest corn-producing State in 1840, and also in 1850, while she yielded the honor to Ohio in 1860.

Virginia stood third as a corn-producing State in 1840, Illinois in 1850, and Missouri in 1860.

Ohio stood fourth in 1840, Indiana in 1850, and again in 1860.

Indiana stood fifth in 1840, Tennessee in 1850, and Kentucky in 1860.

North Carolina stood sixth in 1840, Virginia in 1850, and Tennessee in 1860.

Illinois produces nearly one-seventh of all the corn raised in the States and Territories.

The six States of Illinois, Missouri, Ohio, Indiana, Kentucky, and Tennessee, produced, in 1860, 449,332,502 bushels of Indian corn, or more than half the entire production of the United States and Territories.

It will be observed from the above table that Iowa has increased her production of Indian corn during the last twenty and ten years, more than any other of the great corn-growing States. In twenty years she has increased from less than one and a half million bushels to more than forty-one million bushels. This young State produces nearly half as much corn as all New England and the middle States.

The following table shows the production of Indian corn in the New England States, together with the number of inhabitants, in the years 1860, 1850, and 1840 :

## INTRODUCTION.

*Indian corn in the New England States in 1860, 1850, and 1840, together with the population.*

Total .....	9, 164, 505	10, 175, 856	6, 992, 909	3, 135, 283	2, 728, 116	3, 234, 622

It will be seen that in the last ten years the production of Indian corn has decreased in Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont. This is accounted for, in part, by the fact that the year 1859, to which the census of crops applies, was unusually dry, and the crops in New England suffered considerably. It must be confessed, however, that the figures, making all due allowance for the drought, do not place the agriculture of New England in a favorable light.

The following table shows the production of Indian corn in the middle States, together with the number of inhabitants in the years 1860, 1850, and 1840.

States.	BUSHEL8 OF INDIAN CORN.			POPULATION.		
	1860.	1850.	1840.	1860.	1850.	1840.
New York .....	20, 061, 049	17, 858, 400	10, 972, 286	3, 880, 735	3, 097, 394	2, 428, 951

Maryland .....	13, 444, 932	10, 749, 858	8, 233, 086	687, 040	583, 034	470, 019
District of Columbia .....	80, 840	65, 230	39, 485	75, 080	51, 687	43, 712
Total .....	75, 399, 305	61, 413, 948	39, 916, 213	8, 333, 330	6, 624, 088	5, 118, 076

The production of corn in the middle States increased over twenty millions of bushels from 1840 to 1850, and nearly fourteen millions from 1850 to 1860. When we consider that the production of wheat during the last ten years in the middle States has fallen off very materially, this increase in Indian corn is not more than might have been expected.

The following table shows the production of Indian corn in the southern States, together with the number of inhabitants in the years 1860, 1850, and 1840:

States.	BUSHEL8 OF INDIAN CORN.			POPULATION.		
	1860.	1850.	1840.	1860.	1850.	1840.

# INTRODUCTION.

xlix

Both Tennessee and South Carolina produced less corn in 1860 than in 1850; while Georgia, though showing a slight increase, remains almost stationary. Texas, which was unreported in 1840, gave six million bushels in 1850, and sixteen and a half million in 1860. Arkansas nearly doubled her production of Indian corn from 1840 to 1850, and again from 1850 to 1860. Louisiana also shows a rapid increase—nearly six million bushels. The total increase in the southern States from 1840 to 1850 is a little over fifty-three million bushels of Indian corn, and from 1850 to 1860 less than forty-two and a half million bushels.

The following table shows the production of Indian corn in the western States, together with the number of inhabitants in the years 1860, 1850, and 1840:

The above table is worthy of careful study. It shows at a glance the unparalleled rapidity with which the agricultural resources of the western States are being developed.

Kansas has advanced more rapidly than any other State, having neither crops nor population in 1850. The production of Indian corn has grown up to over five and a half million bushels in 1860.

Minnesota presents also another instance of rapid increase. In 1850 her return of Indian corn was only 16,725 bushels. While in 1860 her product is given at nearly three million bushels, or over one hundred and seventy-eight times as much as in 1850.

Nebraska, which was unreported in 1850, produced nearly 1½ million bushels of Indian corn in 1860, as before stated.

Iowa makes exhibit of remarkable increase in the production of Indian corn. From less than one and a half million bushels in 1840, she has increased to over forty-two million bushels in 1860.

The following table shows the production of Indian corn in the Pacific States, together with the number of inhabitants in the years 1860, 1850, and 1840:

States and Territories.	BUSHELS OF INDIAN CORN.			POPULATION.

## INTRODUCTION.

In the production of Indian corn, as in all other evidences of material prosperity, California presents a conspicuous instance of rapid increase. From 12,236 bushels in 1850, she produces 510,708 bushels of Indian corn in 1860, or over *forty times* as much as in 1850. This is by no means equal to the ratio of increase in Minnesota—only, in fact, one-fourth as great; but it shows, nevertheless, that the golden State is rapidly developing her agricultural resources.

The following table shows the production of Indian corn in the New England, middle, western, southern, and Pacific States in the years 1860, 1850, and 1840, together with the number of inhabitants:

States.	BUSHELS OF INDIAN CORN.			POPULATION.		
	1860.	1850.	1840.	1860.	1850.	1840.
Western .....	470, 190, 097	280, 881, 093	145, 700, 525	10, 247, 003	6, 386, 000	4, 131, 370

Middle .....	75, 300, 300	61, 413, 948	39, 916, 913	8, 333, 230	6, 624, 988	5, 118, 076
New England .....	9, 164, 605	10, 175, 856	6, 992, 009	3, 135, 283	2, 728, 116	2, 234, 822
Pacific .....	1, 301, 328	300, 464	.....	552, 254	178, 818	.....
Total .....	838, 772, 017	562, 071, 104	317, 531, 875	31, 443, 322	23, 191, 876	17, 069, 453

The following table shows the number of bushels of Indian corn produced in the different sections of the United States to each inhabitant, in the years 1860, 1850, and 1840:

	1860.	1850	1840.
New England States .....	2.90	3.70	3.02
Middle States .....	9.04	9.11	7.79
Southern States .....	30.83	32.76	33.13
Pacific States .....	2.55	2.18	.....
Western States .....	45.27	44.14	35.33
The United States and Territories .....	26.12	26.04	22.11

In the New England States the production of corn increased over three million bushels from 1840 to 1850, but *decreased* over a million bushels from 1850 to 1860. *In proportion to population* there was also a slight increase from 1840 to 1850; but a decrease of nearly one bushel to each inhabitant from 1850 to 1860. With the exception of the Pacific States, the New England States, in proportion to population, produce far less Indian corn than any other section in 1860—less than three bushels to each inhabitant.

The middle States have nearly doubled their production of Indian corn since 1840. From 1840 to 1850 the increase was from nearly forty millions to over sixty-one millions of bushels; and in 1860 to over sixty-five millions of bushels.

In proportion to population, the middle States show a slight decrease in the production of Indian corn since the census of 1850, but a decided increase from 1840 to 1850. These States now produce about nine bushels of Indian corn to each inhabitant, or more than three times as much as the New England States.

We have no means of knowing the actual increase in the number of acres planted to Indian corn but it is hardly probable that they have increased more than the increase in the production of this grain. The increase in the population is due mainly to the growth of the cities and villages rather than to an increase in the number of persons engaged in the cultivation of the soil. The table, however, is interesting in reference to our ability to sustain a rapidly increasing population.

Indian corn is probably the best crop for such an object. In the case of an individual farmer we are apt to judge of the character of his farming from the appearance and product of his corn crop; and

what is true of an individual is no less true of a nation. If the average yield of Indian corn is increasing, it is pretty good evidence that our general system of agriculture is improving. For this reason the tables here presented are pre-eminently worthy of study.

In the New England States, as we have shown, the aggregate crop of Indian corn in 1860 was less than in 1850.

In the middle States there has been a steady increase from 1840 to 1850, and from 1850 to 1860; but from 1850 to 1860 this increase in the corn crop has barely kept pace with the increase in population.

In the southern States there has also been a steady increase in the amount of Indian corn produced in 1840, 1850, and 1860. The increase in 1850, as compared with 1840, was about fifty-three million bushels; and from 1850 to 1860 a little less than forty-two and a half millions.

The increase of the corn crop in the southern States, however, has not kept pace with the increase in population. There were produced in 1840 a little over thirty-three bushels to an inhabitant; in 1850, thirty-two and three-fourths bushels, and in 1860 less than thirty-one bushels to each person.

The southern States, it will be seen, produce, in proportion to population, *ten* times as much corn as the New England States, and over three times as much as the middle States.

In the western States the aggregate production of Indian corn was, in round numbers, 145,000,000 bushels in 1840, 280,000,000 bushels in 1850, and 470,000,000 bushels in 1860; while the population, in round numbers, was 4,000,000 in 1840, 6,000,000 in 1850, and 10,000,000 in 1860.

The western States are the only section of the country (except the Pacific States) in which the production of Indian corn has steadily increased in greater proportion than the population. In 1840 the western States produced 35 bushels to each inhabitant; 44 bushels in 1850, and 45 bushels to each person in 1860.

This result is owing, in a good degree, to the increased facilities of transportation, and still more to the improved processes of culture which have followed the introduction of improved implements and machines. In no other section have farmers manifested a greater promptitude to avail themselves of the labors of the inventor and mechanic, and the result is shown in the above table. In no country in the world is there a finer field for the introduction of mechanical appliances for the culture of the soil than on the rich prairies of the western States. It was here that the reaper first found its way into general use; and what is true of the reaper is equally true of nearly all other agricultural machinery. The steam-plough, introduced the present year from England, will here, if anywhere, be speedily employed to pulverize the soil and prepare it for a crop.

Taking the country as a whole, the production of Indian corn to each inhabitant was 22 bushels in 1840, 26 bushels in 1850, and a little over 26 bushels in 1860. The census of 1850 showed an increase of four bushels to each inhabitant, while the last census shows that the production of Indian corn, taking the country as a whole, fully keeps pace with the increase in population.

Illinois not only produces the largest aggregate amount of Indian corn, but also produces more in proportion to population than any other State. She produced 67 bushels of corn to each inhabitant in 1850, and also in 1860, and 47 bushels in 1840.

Iowa comes next. She produced 32 bushels of corn to each inhabitant in 1840, 45 bushels in 1850, and 60 bushels in 1860.

The next highest is Kansas. She produced 52 bushels of corn to each inhabitant in 1860.

Indiana succeeds, with 41 bushels to each inhabitant in 1840, 50 bushels in 1850, and 51 bushels in 1860.

Tennessee stands next. She produced 42 bushels of corn to each person in 1860. This, however, is far less than she produced in 1850 and in 1840. In 1850 she produced 52 bushels of corn to each person, and in 1840, 54 bushels.

## INTRODUCTION.

## CULTURE OF INDIAN CORN.

Little need be said on this subject. Throughout the great western States, the price of Indian corn has usually, till within a year past, been so low that little money or labor could be expended profitably in manuring or cultivating the corn crop. There are millions of acres that seem as though they were formed to produce this magnificent American cereal at the least cost of time and labor. A loose, moist, but not *wet*, fertile soil, with abundance of sunshine, is what is needed for the growth of large crops of Indian corn. The rich bottom lands of the west and southwest are the finest lands in the world for this grain. There are instances where it has been grown annually on such lands for over fifty years without any sensible diminution in the yield either of grain or stalks.

The ease with which Indian corn can be grown, is, perhaps, one reason why there have been so few investigations in regard to the requirements of this important plant. We know something of the best fertilizers of wheat, barley, beans, peas, turnips, and grass, but how few have made investigations respecting the special demands of Indian corn. To increase a crop of wheat from 15 to 25 bushels per acre, we know with considerable certainty the quantity of certain constituents of manure that will be needed; but who can say the same in regard to Indian corn? If a soil without manure yields 30 bushels of Indian corn per acre, who can tell how much ammonia, phosphoric acid, potash, and other elements of plant food, are required to enable it to produce 60 bushels per acre.

In the hope of ascertaining something in regard to this subject, the New York State Agricultural Society offer a standing prize for experiments on this culture. As the subject is one of great importance to the farmers of the whole country, it will be interesting to give the rules laid down for conducting these experiments, and we cannot but hope that farmers in other States will make similar experiments, so that before another census is taken, we shall not have to confess our ignorance in regard to the peculiar manurial requirements of the most important crop of American agriculture.

The following is the plan of experiments suggested: The executive committee of the New York State Agricultural Society, deeming it of great importance to ascertain the manure best adapted to Indian corn, one of the most important crops of this country, propose to award premiums for the best conducted and most satisfactory experiments with the manures hereinafter named.

It is desired that the field upon which the experiment is made, should have been under cultivation for a considerable time; and if it has not been manured, and has been impoverished by continued cultivation of cereal crops, it will be the most acceptable. It is very important to ascertain the amount of phosphoric acid, sulphuric acid, potash, soda, lime, &c., required in the soil for the proper growth of Indian corn.

The *mechanical* condition of the field must be carefully attended to, and all *parts* of the field to be as much alike as possible. *One-fourth* of an acre for each plot, and *two* of these to be without manure of any kind. It is believed that this is as small a quantity of land as will secure reliable results, and it is of the utmost importance that the field experiments should be satisfactory.

Plate or money premium \$75.

No. 1. The following preparations to be tried, each of the numbers representing one-fourth of an acre:

1. Without manure.
2. 4 tons of well-decomposed barn yard manure.
3. 4 tons of green manure from barn yard.
4. 100 pounds sulphate of lime.
5. 100 pounds sulphate of ammonia.
6. 100 pounds of superphosphate of lime.
7. 75 pounds of pearl-ash.
8. 50 pounds of soda-ash.
9. 25 pounds of sulphate of magnesia.
10. 50 pounds of sulphate of lime.

11. 75 pounds of pearlash, 50 pounds of soda-ash, 25 pounds of sulphate of lime, and 25 pounds of sulphate of magnesia.
12. As No. 11, with 100 pounds of sulphate of ammonia.
13. As No. 11, with 100 pounds of superphosphate of lime.
14. As No. 11, with 100 pounds of sulphate of ammonia, and 100 pounds of superphosphate of lime.
15. As No. 11, with 50 pounds of sulphate of ammonia.
16. 50 pounds of sulphate of ammonia.
17. 60 pounds of superphosphate of lime.
18. 4 tons of barn yard manure, 50 pounds each of sulphate of ammonia, superphosphate of lime, pearlash, soda-ash, sulphate of magnesia, and sulphate of lime.
19. Without manure.

If potash, soda-ash, and magnesia cannot be readily obtained, unleached hard-wood ashes may be substituted for them.

The *superphosphate of lime* should be made from calcined bones, and should be placed in direct contact with the seed. The sulphate of ammonia should be applied in the hill, with a little soil intervening between it and the seed. The pearlash or soda-ash must not be mixed with the superphosphate or sulphate of ammonia before sowing. The other substances can be applied as convenience or custom dictates.

*Superphosphate of lime* from calcined bones, ground quite fine before admixture with acid, may be made as follows: Grind the calcined bones very fine; then to 100 pounds of bone-dust add 75 pounds of water, and mix thoroughly; then add 100 pounds of "brown or chamber" sulphuric acid and mix completely, and repeat the process until the quantity required is made. (Such a superphosphate can be sown with the smallest seeds without fear of injuring the germinating principle.)

Hitherto the only experiment that has been made in reference to this prize was conducted by JOSEPH HARRIS, near Rochester, New York. The society awarded him the prize, although the precise conditions of the experiments were not adhered to. As the first, and indeed the only experiments of the kind ever made in this country, we need offer no apology for embodying them in this report.

The soil on which the experiments were made is a light sandy loam. It has been under cultivation for upwards of twenty years, and, so far as could be ascertained, had never been manured. It had been somewhat impoverished by the growth of cereal crops, and it was thought that for this reason, and on account of its light texture and active character, which would cause the manures to act immediately, it was well adapted to the purpose of showing the effect of different manurial substances on the corn crop. The land was a clover sod, two years old, pastured the previous summer. It was ploughed early in the spring and harrowed till in excellent condition. The corn was planted May 23, in hills three and one-half feet apart each way. Each experiment was made on the one-tenth of an acre, and consisted of four rows, with one row between each plot, without any manure. The manures were applied in the hill immediately before the seed was planted. With the superphosphate of lime, and with plaster, (gypsum, or *sulphate of lime*,) the seed was placed directly on top of the manure. The ashes were dropped in the hill and covered with soil, upon which the seed was planted, that it should not come in contact with the ashes. Guano and sulphate of ammonia were treated in the same way. On the plots where ashes and guano or ashes and sulphate of ammonia were both used, the ashes were first put in the hill and covered with soil, and the guano or sulphate of ammonia placed above, and also covered with soil before the seed was planted. The ashes and superphosphate of lime were treated in the same way. It is well known that unleached ashes, mixed either with guano, sulphate of ammonia, or superphosphate of lime, mutually decompose each other, setting free the ammonia of the guano and sulphate of ammonia, and converting the soluble phosphate of the superphosphate of lime into the insoluble form in which it existed before treatment with sulphuric acid. All the plots were planted on the same day, and the manures weighed and applied under Mr. Harris's immediate supervision. Everything was done that seemed necessary to secure accuracy.

## INTRODUCTION.

The following table gives the results of the experiments :

*Table showing the results of experiments on Indian corn near Rochester, New York.*

Number of the plots.	Descriptions of manure and quantities applied per acre.	Bushels of ears of sound corn per acre.	Bushels of ears of soft corn per acre.	Total number of bushels of ears of corn per acre.	Increase per acre of ears of sound corn.	Increase per acre of ears of soft corn.	Total increase per acre of ears of corn.

10	400 pounds unleached wood-ashes.....	60	8	68	.....	1	1
11	100 pounds plaster, 400 pounds unleached wood-ashes, 300 pounds superphosphate of lime, and 200 pounds Peruvian guano .....	95	10	105	35	3	38
12	75 pounds sulphate of ammonia.....	78	10	88	18	3	21
13	200 pounds Peruvian guano .....	88	13	101	23	6	29
14	400 pounds unleached wood-ashes, 100 pounds plaster, and 500 pounds Peruvian guano.	111	14	125	51	7	58

The superphosphate of lime was formed especially for these experiments, and was a pure mineral manure of superior quality, made from calcined bones; it cost about two and a half cents per pound. The sulphate of ammonia was a good commercial article obtained from London at a cost of about seven cents per pound. The ashes were made from beech and hard maple (*acer saccharinum*) wood, and were sifted through a fine sieve before being weighed. The guano was the best Peruvian, costing about three cents per pound. It was crushed and sifted before using. In sowing the ashes on plot 7 an error occurred in their application, and for the purpose of checking the result, it was deemed advisable to repeat the experiment on plot 10.

On plot 5, with 300 pounds of superphosphate of lime per acre, the plants came up first, and exhibited a healthy, dark-green appearance, which they retained for some time. This result was not anticipated, though it is well known that superphosphate of lime has the effect of stimulating the germination of turnip-seed, and the early growth of the plants to an astonishing degree; yet, as it has no such effect on wheat, it seemed probable that it would not produce this effect on Indian corn, which in chemical composition is very similar to wheat. The result shows how uncertain are all speculations in regard to the manurial requirements of plants. This immediate effect of superphosphate of lime on corn was so marked that the men (who were at the time of planting somewhat inclined to be skeptical in regard to the value of such small doses of manure) declared that "superphosphate beats all creation for corn." The difference in favor of superphosphate at the time of hoeing, was very perceptible even at some distance.

Although every precaution deemed necessary was taken to prevent the manures from mixing in the hill, or from injuring the seed, yet it was found that those plots dressed with ashes and guano, or with ashes and sulphate of ammonia, were injured to some extent. Shortly after the corn was planted heavy rain set in and washed the sulphate of ammonia and guano down into the ashes, and mutual decomposition took place, with more or less loss of ammonia. In addition to this loss of ammonia these manures came up to the surface of the ground in the form of an excrecence so hard that the plants could with difficulty penetrate through it. This is a fact which should be borne in mind in

instituting future experiments. It would have been better, undoubtedly, to have sown these manures broadcast, except for the difficulty of sowing them evenly by hand on so narrow a plot without risk of having some part of the manures blown upon the adjoining plots.

It will be seen by examining the table, that, although the superphosphate of lime had a good effect during the early stages of the growth of the plants, yet the increase of product did not come up to these early indications. On plot 5, with 300 pounds of superphosphate of lime per acre, the yield is precisely the same as on plot 2, with 100 pounds of plaster (*sulphate of lime*) per acre. Now, superphosphate of lime is composed, necessarily, of soluble phosphate of lime and plaster, or sulphate of lime formed from a combination of the sulphuric acid employed in the manufacture of superphosphate with the lime of the bones. In the 300 pounds of superphosphate of lime sown on plot 5 there would be about 100 pounds of plaster, and as the effect of this dressing is no greater than was obtained from the 100 pounds plaster sown on plot 2, it follows that the good effect of the superphosphate of lime was due to the plaster which it contained.

Again, on plot 4, with 150 pounds of sulphate of ammonia per acre, we have ninety bushels of ears of sound corn, and fifteen bushels of ears of soft corn ("nubbins") per acre, or a total increase over the plot without manure, of thirty-eight bushels. Now, the sulphate of ammonia contains no phosphate of lime, and the fact that such a manure gives a considerable increase of crop confirms the conclusion arrived at from a comparison of the results on plots 2 and 5, that the increase from the superphosphate of lime is not due to the phosphate of lime which it contains, unless we are to conclude that the sulphate of ammonia rendered the phosphate of lime in the soil more readily soluble, and thus furnished an increased quantity in an available form for assimilation by the plants—a conclusion which the results with superphosphate alone, on plot 5, and with superphosphate and sulphate of ammonia combined, on plot 6, do not sustain.

On plot 12 half the quantity of sulphate of ammonia was used as on plot 4, and the increase is a little more than half what it is where double the quantity was used.

Again, on plot 13, 200 pounds of Peruvian guano per acre gives nearly as great an increase of sound corn as the 150 pounds of sulphate of ammonia. Now, 200 pounds of Peruvian guano contains nearly as much ammonia as 150 pounds sulphate of ammonia, and the increase in both cases is evidently due to the ammonia of these manures. The 200 pounds of Peruvian guano contained about 50 pounds of phosphate of lime; but as the sulphate of ammonia, which contains no phosphate of lime, gives as great an increase as the guano, it follows that the phosphate of lime in the guano had little if any effect—a result precisely similar to that obtained with superphosphate of lime.

We may conclude, therefore, that on this soil, which had never been manured, and which had been cultivated for many years with the *ceralia*—or, in other words, with crops which remove a large quantity of phosphate of lime from the soil—the phosphate of lime, relatively to the ammonia, is not deficient. If such were not the case, an application of soluble phosphate of lime would have given an increase of crop, which we have shown was not the case in any one of the experiments.

Plot 10, with 400 pounds of unbleached wood-ashes per acre, produces the same quantity of *sound corn*, with an extra bushel of "nubbins" per acre, as plot 1, without any manure at all; ashes, therefore, applied alone, may be said to have had no effect whatever. On plot 3, 400 pounds of ashes, and 100 pounds of plaster, give the same total number of bushels per acre as plot 2, with 100 pounds plaster alone. Plot 8, with 400 pounds of ashes and 150 pounds sulphate of ammonia, yields three bushels of sound corn and five bushels of "nubbins" per acre *less* than plot 4, with 150 pounds sulphate of ammonia alone. This result may be ascribed to the fact previously alluded to—the ashes dissipated some of the ammonia.

Plot 11, with 100 pounds of plaster, 400 pounds ashes, 300 pounds of superphosphate of lime, and 200 pounds Peruvian guano, (which contains about as much ammonia as 150 pounds sulphate of ammonia,) produced precisely the same total number of bushels per acre as plot 4, with 150 pounds sulphate of ammonia alone, and but four bushels more per acre than plot 13, with 200 pounds Peruvian guano

alone. It is evident, from these results, that neither ashes nor phosphates had much effect on Indian corn on this impoverished soil.

Plot 14 received the largest dressing of ammonia, (500 pounds of Peruvian guano,) and produced much the largest crop, though the increase is not so great in proportion to the guano as where smaller quantities were used.

The manure which produced the most profitable result was the 100 pounds of plaster on plot 2. The 200 pounds of Peruvian guano on plot 13, and which cost about \$6, gave an increase of fourteen bushels of shelled corn and six bushels of "nubbins." The superphosphate of lime, although a very superior article, and estimated at cost price, in no case paid for itself. The same is true of the ashes.

But the object of the experiment was not so much to ascertain what manures will pay, as to ascertain, if possible, what constituents of manures are required in greatest quantity for the maximum production of corn. All our agricultural plants are composed of the same elements; the only difference being in the relative proportions in which they exist in the plants. Thus, wheat and turnips contain precisely the same elements, but the ash of wheat contains five times as much phosphoric acid as the ash of turnips; while the turnips contain much more potash than wheat. This fact being ascertained by chemical analysis, it was supposed that wheat required a manure relatively richer in phosphoric acid than was required for turnips. This is certainly a plausible deduction; but careful and numerous experiments have incontrovertibly proved that such is not the case; in fact, that an ordinary crop of turnips requires more phosphoric acid, in an available condition in the soil, than an ordinary crop of wheat. From this fact, and several others of a similar character, the conclusion is irresistible, that the chemical composition of a plant—the relative proportion in which the several elements exist in the plant—is not a certain indication of the manurial requirements of the plant; or, in other words, it does not follow that because a plant contains a relatively larger proportion of any particular element, that the soil or manure best adapted for the growth of this plant must contain a relatively larger proportion of this element.

Wheat, rye, barley, oats, and Indian corn all contain a relatively large quantity of phosphate of lime; but it is not safe to conclude from this, that a soil or manure best adapted for their maximum growth must also contain a relatively large quantity of phosphate of lime. It is known positively, from numerous experiments, that such is not the case with wheat; and it is, therefore, at least doubtful whether such is true of Indian corn. On the other hand, we know, from repeated experiments, that wheat requires a large quantity of ammonia for its maximum growth; and as Indian corn is nearly identical in composition to wheat, it is somewhat probable that it requires food similar in composition. This, however, is merely a deduction—never a safe rule in agriculture. We cannot obtain positive knowledge in regard to the requirements of plants, except from actual experiments. Numerous experiments have been made in this country with guano and superphosphate of lime; but the superphosphates used were commercial articles, containing more or less ammonia; and if they are of any benefit to those crops to which they are applied, it is a matter of uncertainty whether the beneficial effect of the application is due to the soluble phosphate of lime or to the ammonia. On the other hand, guano contains both ammonia and phosphate, and we are equally at a loss to determine whether the effect is attributable to the ammonia or phosphate, or both. In order, therefore, to determine satisfactorily which of the several ingredients of plants is required in greatest proportion for the maximum growth of any particular crop, we must apply the ingredients separately, or in such definite compounds as will enable us to determine to what particular element or compounds the beneficial effect is to be ascribed. It was for this reason that sulphate of ammonia and a purely mineral superphosphate of lime were used in the above experiments. No one would think of using sulphate of ammonia at its present price as an ordinary manure, for the reason that the same quantity of ammonia can be obtained in other substances, such as barn-yard manure, Peruvian guano, &c., at a much cheaper rate. But these manures contain ALL the elements of plants, and we cannot know whether the effect produced by them is due to the ammonia, phosphates, or any other ingredient. For the purpose of experiment, therefore, we

must use a manure that furnishes ammonia without any admixture of phosphates, potash, soda, lime, magnesia, &c., even though it cost much more than we could obtain the same amount of ammonia for in other manures. These remarks are made in order to correct a very common opinion, that if experiments do not *pay* they are useless. The ultimate object, indeed, is to ascertain the most profitable method of manuring; but the *means* of obtaining this information cannot, in all cases, be profitable.

Similar experiments to those made on Indian corn were made on soil of a similar character on about an acre of sorghum or Chinese sugar-cane. We have not space to give the results in detail at this time, and allude to them merely to mention one very important fact—the *superphosphate of lime had a very marked effect*. This manure was applied in the hill on one plot (the twentieth of an acre) at the rate of 400 pounds per acre, and the plants on this plot came up first, and outgrew all the others from the start, and ultimately attained the height of about ten feet, while on the plot receiving no manure the plants were not five feet high. This is a result entirely different from what Mr. Harris expected. He supposed, from the fact that superphosphate of lime had no effect on wheat, that it would probably have little effect on corn, or on the sugar-cane, or other *ceralia*; and that as ammonia is so beneficial for wheat, it would probably be beneficial for corn and sugar-cane. The above experiment indicates that such is the case in regard to Indian corn, so far as the production of grain is concerned, though, as we have stated, it is not true in reference to the early growth of the plants. The superphosphate of lime on Indian corn stimulated the growth of the plants in a very decided manner at first—so much so that Mr. Harris was led to suppose for some time that it would give the largest crops, but at harvest it was found that it produced no more corn than plaster. These results seem to indicate that superphosphate of lime stimulates the growth of stalks and leaves, and has little effect in increasing the production of seed. In raising Indian corn for fodder, or for soiling purposes, superphosphate of lime may be beneficial as well as in growing the sorghum for sugar-making purposes, or for fodder, though perhaps not for seed.

In addition to the experiments given above, Mr. Harris made the same season, on an adjoining field, another set of experiments on Indian corn, the results of which are interesting.

The land on which these experiments were made, was of a somewhat firmer texture than that on which the other set of experiments was made. It is situated about a mile from the barn-yard, and on this account had seldom if ever been manured. It had been cultivated for many years with ordinary farm crops. It was ploughed early in the spring, and harrowed until quite mellow. The corn was planted May 30. Each experiment occupied *one-tenth of an acre*, consisting of four rows three and a half feet apart, and the same distance between the hills in the rows, with one row without manure between each experimental plot.

The manure was applied in the hill in the same manner as in the first set of experiments.

The barn-yard manure was well rotted, and consisted principally of cow-dung, with a little horse-dung. Twenty two-horse wagon-loads of this was applied per acre, and each load would probably weigh about one ton. It was put in the hill and covered with soil, and the seed then planted on the top.

The following table gives the results of the experiments:

*Table showing the results of experiments on Indian corn near Rochester, New York.*

Number of the plots.	Descriptions of manure and quantities applied per acre.	Bushels of ears of sound corn per acre.	Bushels of ears of soft corn per acre.	Total number of bushels of ears of corn per acre.	Increase ears of sound corn per acre over unmanured plot.	Increase ears of soft corn per acre over unmanured plot.	Total increase of ears of corn per acre.
1	No manure.....	75	12	87	.....	.....	.....
2	20 loads barn-yard manure.....	82½	10	92½	7½	.....	5½
3	150 pounds sulphate of ammonia.....	85	30	115	10	18	28
4	300 pounds superphosphate of lime.....	88	10	98	13	.....	11
5	400 pounds Peruvian guano.....	90	30	120	15	18	33
6	400 pounds of "cancerine," or fish manure..	85	20	105	10	8	18

As before stated, the land was of a stronger nature than that on which the first set of experiments was made, and it was evidently in better condition, as the plot having no manure produced twenty bushels of ears of corn per acre more than the plot without manure in the other field.

On plot 4, 300 pounds of superphosphate of lime gives a total increase of eleven bushels of ears of corn per acre over the unmanured plot, agreeing exactly with the increase obtained from the same quantity of the same manure on plot 5, in the first set of experiments.

Plot 3, dressed with 150 pounds of sulphate of ammonia per acre, gives a total increase of 28 bushels of ears of corn per acre over the unmanured plot, and an increase of  $22\frac{1}{2}$  bushels of ears per acre over plot 2, which received twenty loads of good, well-rotted barn-yard dung per acre.

Plot 5, with 400 pounds of Peruvian guano per acre, gives the best crop of this series, viz: an increase of 33 bushels of ears of corn per acre over the unmanured plot, and  $27\frac{1}{2}$  over the plot manured with twenty loads of barn-yard dung. The 400 pounds of "cancerine," an artificial manure made in New Jersey, from fish, gives a total increase of 18 bushels of ears per acre over the unmanured plot, and  $12\frac{1}{2}$  bushels more than that manured with barn-yard dung; though 5 bushels of ears of sound corn and 10 bushels of "nubbins" per acre less than the same quantity of Peruvian guano.

At the present price of Indian corn, artificial manures can be used with considerable profit, but the main dependence of the farmer must still be on barn-yard manure. The light, concentrated fertilizers should be used as auxiliaries to barn-yard manure. In this way they will prove of great advantage. Anything which increases the crop of Indian corn increases the means of making more manure, and that of a better quality.

The great bulk of our farmers, however, will still rely on natural sources for their manure; and, happily, there are comparatively few soils on which Indian corn will not produce a fair return if the soil is thoroughly cultivated. With our improved horsehoes and cultivators, there is no excuse for those farmers who neglect to keep their corn land mellow and entirely free from weeds. When this is done, we can, in ordinary seasons, and on the majority of soils, be sure of a good crop of Indian corn. It must be confessed, however, that there are too many farmers who fail to practice this thorough cultivation. One of the greatest advantages of the corn crop is, that, being planted in rows at from three to four feet apart, the horsehoe can be used to clean the land. In this respect Indian corn is a "fallow crop;" and it is much to be regretted that so many farmers neglect to avail themselves of this means of cleaning their land. They would find that the repeated stirring of the soil would not only destroy the weeds, but would make the soil moister in dry weather, and increase its fertility by developing the plant-food locked up in the land. Thorough cultivation alone, would double the average yield of Indian corn in the United States, besides leaving the land cleaner and in much better condition for future crops.

## R Y E.

*Bushels of rye produced in 1860.*

The amount of rye produced in the United States in 1840 was 18,645,567 bushels; in 1850, 14,188,813 bushels; and in 1860, 21,101,380 bushels.

Pennsylvania and New York are the largest producers of rye. These two States produce nearly as much rye as all the other States and Territories together. New Jersey also produces largely, raising nearly as much rye as wheat. It is a crop well adapted for light sandy soils, and in the neighborhood of large cities is a profitable crop, not so much, however, for the grain as for the straw.

The following table shows the amount of rye raised in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut.....	618, 702	600, 893
Maine.....	123, 287	102, 916

Vermont.....	139, 271	176, 233
	<u>1, 425, 851</u>	<u>1, 570, 589</u>

## INTRODUCTION.

The production of rye in the New England States, has fallen off somewhat since 1850, and yet more since 1840. They continue, however, to raise more rye than wheat. In 1860 the New England States produced only 1,077,285 bushels of wheat, against 1,425,851 bushels of rye.

The following table shows the amount of rye raised in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York.....	4,786,905	4,143,182
New Jersey.....	1,439,497	1,255,578
Pennsylvania.....	5,474,788	4,805,160
Maryland.....	518,901	226,014
Delaware.....	27,209	8,066
District of Columbia.....	6,919	5,509
	<u>12,254,219</u>	<u>10,448,509</u>

The production of rye has increased in all the middle States. It has increased more than three-fold in Delaware, and more than double in Maryland. It is, however, a small crop in these States. Pennsylvania, New York, and New Jersey produce nearly all the rye raised in the middle States.

The following table shows the amount of rye raised in the western States in 1860, as compared with 1850:

	1860.	1850.
Ohio.....	683,686	425,918
Indiana.....	463,495	78,792
Michigan.....	514,129	105,871
Illinois.....	951,281	83,364
Wisconsin.....	888,544	81,233
Iowa.....	183,022	19,916
Missouri.....	293,262	44,268
Kentucky.....	1,055,260	415,073
Kansas.....	3,833	.....
Nebraska.....	2,495	.....
Minnesota.....	121,411	125
	<u>5,160,418</u>	<u>1,254,580</u>

There is a marked increase in the production of rye in all the western States. In the aggregate there is four times as much rye raised in the western States as in 1850. Rye, however, is not an important crop in the west. Pennsylvania alone produces more rye than all the western States.

The following table shows the amount of rye raised in the southern States in 1860, as compared with 1850:

	1860.	1850.
Virginia.....	944,330	458,930
North Carolina.....	436,856	229,563
South Carolina.....	89,091	43,790
Georgia.....	115,532	53,750
Alabama.....	72,457	17,261
Louisiana.....	36,065	475
Texas.....	111,860	3,108
Mississippi.....	39,474	9,606
Arkansas.....	78,092	8,047
Tennessee.....	257,989	89,137
Florida.....	21,306	1,152
	<u>2,203,052</u>	<u>1,014,819</u>

The production of rye in the southern States, it will be seen, has doubled since 1850. Virginia and North Carolina are, by far, the largest producers of rye in the southern States, though there it is by no means an important crop.

The following table shows the amount of rye raised in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California.....	52,140	....
Oregon.....	2,704	106
New Mexico.....	1,300	....
Washington.....	144	....
Utah.....	754	210
	<hr/> 57,042	<hr/> 316
	<hr/>	<hr/>

California produces nearly all the rye grown in the Pacific States, though there it is not extensively cultivated.

The following table shows the amount of rye raised in the different sections of the United States in 1850 and in 1860, in proportion to the population:

	1860.	1850.
New England States.....	0.42	0.57
Western States.....	0.49	0.19
Middle States.....	1.47	1.57
Southern States.....	0.27	0.13
Pacific States.....	0.10	0.001
	<hr/> 0.66	<hr/> 0.64
United States.....	<hr/>	<hr/>

Much more rye than wheat is raised in New England, and the crop has increased, as we have before shown from 1850 to 1860, but, as the above table shows, it has hardly kept pace with the increase in population. There is nearly half a bushel of rye raised in the New England States to each inhabitant. The western States also raise about half a bushel of rye to each person. There is nearly three times as much rye raised in the western States to each inhabitant as was raised in 1850.

The middle States produce about one and a half bushel of rye to each inhabitant. There is, however, a slight falling off in proportion to population since 1850.

In the States and Territories there were sixty-four hundredths of a bushel of rye raised to each inhabitant in 1850, and sixty-six hundredths in 1860, showing a slight increase in proportion to population.

#### CULTURE OF RYE.

Of all the bread-plants, rye will succeed best on the driest and poorest soils. It will grow where wheat, barley, oats, and Indian corn would fail. With the aid of a little manure it can be grown year after year on the same soil. It is exceedingly grateful for manure, and its application to this crop is quite profitable, especially in localities where the straw is in demand.

Rye can be sown either earlier or later than winter wheat. In sections where corn cannot be harvested in time to sow winter wheat, rye is frequently substituted after Indian corn.

In England and in France, on the light soils where wheat alone is rather an uncertain crop, it is common to sow rye with the wheat—say half a bushel of rye to two bushels of wheat. Large crops are thus produced, and the farmers use the mixture, when ground and bolted, for domestic use. It is called "monk corn." In Germany, under the name of "meslin," in France, "meteil," the same mixture is extensively used. There is no sweeter bread than that made of these mixed grains, and its long retention of moisture would render it valuable and popular as an army bread.

*Production of wheat, rye, and corn, in proportion to population.*—It may be well here to group together the principal bread-crops of the United States for the years 1850 and 1860, to facilitate

parisons respecting the aggregate product of these cereals. In 1850 the United States, with a population of 23,191,876, exclusive of Indian tribes, produced 100,485,944 bushels of wheat, or 4.33 to each inhabitant; 14,188,813 bushels of rye, or 0.61 to each inhabitant; and 592,071,104 bushels of corn, or 25.53 to each inhabitant.

In 1860, with a population, exclusive of Indian tribes, of 31,443,321, there were 173,104,924 bushels of wheat produced, or 5.50 to each inhabitant, showing an increase of one bushel and one-sixth to each inhabitant, or an increase, in proportion to population, of twenty-seven per cent. Of rye there were 21,101,380 bushels produced, or 0.67 to each inhabitant, showing an increase of 0.06 to each inhabitant, or an increase, in proportion to population, of about ten per cent. Of corn there were 838,792,740 bushels produced, or 26.73 to each inhabitant, showing an increase of 1.20 to each inhabitant, or an increase, in proportion to population, of 4.7 per cent.

The aggregate product of wheat, rye, and corn produced in the United States in 1850 was 706,745,861 bushels, or 30.47 to each inhabitant. In 1860 the aggregate product of wheat, rye, and corn was 1,032,999,044 bushels, or 32.90 to each inhabitant; an increase, in proportion to population, of 7.97 per cent.

The New England States, with a population of 2,728,116 in 1850, produced 1,090,894 bushels of wheat, or only thirteen quarts to each inhabitant. In 1860, with a population of 3,135,283, the New England States produced 1,083,193 bushels, or about eleven quarts and a half to each inhabitant, showing a decrease, in proportion to population, of 34.7 per cent. Of rye, the New England States produced in 1850 1,570,589 bushels, or 0.539 to each inhabitant.

In 1860 they produced 1,425,851 bushels, or 0.455 to each inhabitant, being a decrease, in proportion to population, of 18.46 per cent. The same States in 1850 produced 10,175,856 bushels of corn, or 3.73 to each inhabitant. In 1860 they produced 9,164,505 bushels of corn, or 2.92 to each inhabitant; a decrease, in proportion to population, of 27.74 per cent.

The aggregate of wheat, rye, and corn produced in the New England States in 1850 was 12,837,339 bushels, or 4.73 to each inhabitant. In 1860 the aggregate of wheat, rye, and corn produced was 11,673,549 bushels, or 3.72 to each inhabitant, showing a decrease, in proportion to population, of twenty-seven per cent.

The middle States, New York, New Jersey, Pennsylvania, Delaware, and Maryland, in 1850, with a population of 6,573,301, produced 35,067,570 bushels of wheat, or 5.33 to each inhabitant. The same States, in 1860, with a population of 8,258,150, produced 30,502,909 bushels, or 3.69 to each inhabitant; a decrease, in proportion to population, of 44.4 per cent. Of rye, these States, in 1850, produced 10,443,000 bushels, or 1.58 to each inhabitant. In 1860 the product was 12,247,300 bushels, or 1.48 to each inhabitant, being a decrease of 6.7 per cent. in proportion to population. Of corn there were produced in 1850 60,348,718 bushels, or 9.18 to each inhabitant. In 1860 there were produced 75,318,465 bushels, or 9.12 to each inhabitant; a decrease, in proportion to population, of 0.65 per cent. The aggregate of wheat, rye, and corn produced in the middle States in 1850 was 105,859,288 bushels, or 16.1 to each inhabitant. In 1860 the aggregate product was 118,068,674 bushels, or 14.29 to each inhabitant; a decrease, in proportion to population, of 12.6 per cent.

The western States, Ohio, Michigan, Wisconsin, Minnesota, Iowa, Kansas, Missouri, Kentucky, Indiana, and Illinois, in 1850, with a population of 6,379,723, produced 46,076,318 bushels of wheat, or 7.22 to each inhabitant. The same States, in 1860, with a population of 10,218,722, produced 102,251,127 bushels, or 10 to each inhabitant; an increase, in proportion to population, of 38.5 per cent. Of rye, the product in 1850 was 1,254,580 bushels, or 0.196 to each inhabitant. In 1860 the product was 5,157,923 bushels, or 0.504 to each inhabitant; being an increase, in proportion to population, of 157 per cent. Of corn, the product in 1850 was 280,881,093 bushels, or 44 to each inhabitant. In 1860 the product was 468,708,017 bushels, or 45.86 to each inhabitant; an increase, in proportion to population, of 4 per cent. The aggregate of wheat, rye, and corn produced in 1850 was 328,211,991 bushels, or 51.4 to each inhabitant. In 1860 the aggregate was 576,117,067 bushels, or 56.36 to each inhabitant; an increase, in proportion to population, of 9.63 per cent.

The southern States—Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, and Texas—in 1850, with a population of 7,373,954, produced 17,791,761 bushels of wheat, or 2.42 to each inhabitant. In 1860 the same States, with a population of 8,975,124, produced 31,441,826 bushels, or 3.50 to each inhabitant; an increase, in proportion to population, of 44.6 per cent. In 1850 the product of rye was 914,819 bushels, or 0.12 to each inhabitant. In 1860 the quantity produced was 2,203,052 bushels, or 0.256 to each inhabitant; an increase, in proportion to population, of 113.3 per cent. The product of corn in 1850 was 240,209,743 bushels, or 32.68 to each inhabitant. In 1860 the product was 282,626,778 bushels, or 31.49 to each inhabitant; a decrease, in proportion to population, of 3.78 per cent. The aggregate of wheat, rye, and corn produced in 1850 was 258,916,323 bushels, or 35.2 to each inhabitant. In 1860 the aggregate was 316,271,656 bushels, or 35.24 to each inhabitant; the number of bushels to each inhabitant being the same as in 1850.

Ohio .....	15, 409, 234	Aggregate .....	172, 643, 185
Oregon .....	885, 673		

More oats than wheat is raised in the United States by over a million bushels. In 1860 there were 172,643,185 bushels of oats raised, against 146,584,179 bushels in 1850. The increase is by no means equal to the increase in population, and is far less than the increase in wheat and Indian corn.

New York is the greatest oat-growing State in the Union, producing 35,175,134 bushels. Pennsylvania comes next, producing 27,387,147 bushels. Ohio stands third, producing 15,409,234 bushels. Illinois is fourth, producing 15,220,029 bushels. Wisconsin stands fifth, producing 11,059,270 bushels. Virginia comes next, producing 10,186,720 bushels.

The four States of New York, Pennsylvania, Ohio, and Illinois, produce more oats than all the other States and Territories.

The New England States produced 10,766,523 bushels in 1860, against 8,101,268 in 1850, as follows:

	1850.	1850.
Maine.....	2, 988, 939	2, 181, 037
New Hampshire.....	1, 329, 233	973, 381
Vermont.....	3, 630, 267	2, 307, 734
Massachusetts.....	1, 180, 075	1, 165, 146
Rhode Island.....	234, 453	215, 232
Connecticut.....	1, 522, 218	1, 258, 738
	<u>10, 885, 185</u>	<u>8, 101, 268</u>

Vermont is the largest oat-producing State in New England, Maine coming next. Both these States fell off in the production of Indian corn in 1860 as compared with 1850; but the oat crop has materially increased. In none of the New England States has there been any falling off in the production of oats, while in the aggregate there has been an increase of over 25 per cent.

In the middle States, the oat crop has increased from 54,323,836 bushels in 1850, to 72,137,170 bushels in 1860, as follows:

	1860	1850.
New York.....	35,175,133	26,552,814
New Jersey.....	4,539,132	3,378,063
Maryland.....	3,959,298	2,242,151
Pennsylvania.....	27,387,149	21,538,156
Delaware.....	1,046,910	604,518
District of Columbia.....	29,548	8,134
	<u>72,137,170</u>	<u>54,323,836</u>

There is no falling off in any of the middle States. The increase from 1850 to 1860, in the aggregate, is over 25 per cent.

In 1860, as compared with 1850, the production of wheat in the middle States, as we have before remarked, fell off nearly five millions of bushels. On the other hand, the crop of Indian corn *increased* in the same period nearly fourteen millions of bushels; and, as will be seen from the above table, the crop of oats also increased in the same period nearly eighteen millions of bushels. In other words, while we lose five million bushels of wheat, we gain nearly thirty-two million bushels of Indian corn and oats. The decrease in the production of wheat, caused by the midge, is not an unmixed evil—the land has been devoted to other crops.

The following table shows the amount of oats raised in the western States in 1860 and 1850:

	1860.	1850.
Illinois.....	15,220,029	10,087,241
Indiana.....	5,317,381	5,655,014
Iowa.....	5,887,645	1,624,345
Kansas.....	88,325	
Kentucky.....	4,617,029	8,201,311
Michigan.....	4,036,980	2,866,056
Minnesota.....	2,176,002	30,682
Missouri.....	3,680,870	5,278,079
Ohio.....	15,409,234	13,472,742
Wisconsin.....	11,059,260	3,414,672
Nebraska.....	74,592	
	<u>67,567,257</u>	<u>48,530,042</u>

Ohio produces more oats than any other western State. Illinois produces nearly as much, and shows a much greater increase than Ohio since 1850. Wisconsin comes next. The production of oats in this State has increased from less than three and a half million bushels in 1850 to over eleven million bushels in 1860.

The three States of Ohio, Illinois, and Wisconsin produce over 62 per cent. of all the oats raised in the western States. In round numbers these three States produce forty-two million bushels of oats, while all the other western States produce only twenty-five million bushels.

In the production of oats, as in other crops, Minnesota shows a rapid increase. In 1860 she produced over two million bushels of oats against thirty thousand bushels in 1850. Iowa, Wisconsin, and Michigan show a marked increase in the yield of oats. Indiana, on the other hand, has slightly decreased. Kentucky has fallen off nearly one-half. Missouri also shows a marked decrease in the oat crop, falling off from five million bushels in 1850 to three and a half million bushels in 1860.

## INTRODUCTION.

On the whole, the western States do not show as great an increase in the production of oats as of Indian corn or wheat. The most remarkable decrease in the oat crop, however, is in the southern States. This will be seen from the following table, showing the production of oats in the different southern States in 1860 and 1850:

	1860.	1850.
Alabama.....	682, 179	2, 965, 696
Arkansas.....	475, 268	656, 183
Florida.....	46, 899	66, 586
Georgia.....	1, 231, 817	3, 820, 044
Louisiana.....	89, 377	89, 637
Mississippi.....	221, 235	1, 503, 258
North Carolina.....	2, 781, 860	4, 052, 078
South Carolina.....	936, 974	2, 322, 155
Tennessee.....	2, 267, 814	7, 703, 086
Texas.....	985, 889	199, 017
Virginia.....	10, 186, 720	10, 179, 144
	<u>19, 906, 032</u>	<u>33, 566, 913</u>

With the exception of Texas and Virginia, the oat crop has fallen off in every southern State. The crop in Alabama fell off from nearly three million bushels in 1850 to less than three-quarters of a million in 1860. Mississippi falls off from one and a half million to two hundred and twenty thousand, and other States, as will be seen from the table, also fall off to an equal extent.

This rapid decrease in the production of oats in the slave States is quite curious. In the table showing the amount of oats raised in the western States it will be observed that Kentucky and Wisconsin showed a marked falling off in the production of oats. It is probable, however, that the system of labor there adopted, has less to do with the fact than the nature of the climate. Oats are essentially a northern crop; and, while they flourish well in the southwest, it is doubtless found that other crops which do not thrive so well in a more northern latitude can be raised south with greater profit.

The following table shows the production of oats in the Pacific States:

	1860.	1850.
California.....	1, 043, 006	.....
Oregon.....	885, 673	61, 214
New Mexico.....	7, 246	5
Washington.....	134, 334	.....
Utah.....	63, 211	10, 900
	<u>2, 133, 420</u>	<u>72, 119</u>

California, which was unreported in 1850, produces over a million bushels in 1860. Oregon also has increased to an almost equal extent.

The following table shows the production of oats in the different sections of the country in 1850 and in 1860 in proportion to population:

	1860.	1850.
New England States.....	3.43	2.95
Middle States.....	8.65	8.20
Western States.....	6.51	7.59
Southern States.....	2.18	4.46
Pacific States.....	4.00	0.40
	<u>5.49</u>	<u>6.32</u>
United States.....	<u>5.49</u>	<u>6.32</u>

The New England States produced about the same quantity of oats as of Indian corn ; but, while there has been a falling off in the production of Indian corn, in proportion to population, between 1850 and 1860, the production of oats has increased about half a bushel to each inhabitant, or from 2.95 bushels in 1850 to 3.43 bushels in 1860.

The middle States raise more oats, in proportion to population, than any other section. In the production of wheat there has been a great falling off from 1850 to 1860, and in Indian corn there was a slight decline in proportion to population ; but the oat crop has increased more than enough to make up for the deficiency in the corn crop, though by no means sufficient, in proportion to population, to make up for the decrease in the yield of wheat. In 1860 the middle States produced about nine bushels of Indian corn to each person, and a little over eight and one-half bushels of oats.

The western States, which produce over 45 bushels of Indian corn, produce only six and one-half bushels of oats to each inhabitant. The increase in the production of oats in the western States does not keep pace with the increase in population. In 1860, as compared with 1850, there is a falling off of over one bushel of oats to each person.

The southern States produced nearly four and one-half bushels of oats to each person in 1850, and only a fraction over two bushels in 1860.

The Pacific States, in 1860, produced four bushels of oats to each person.

Taking the country as a whole, the production of oats has not kept pace with the increase in population. In 1850 we produced six and three-tenths bushels to each person, and in 1860 less than five and one-half bushels.

#### THE CULTURE OF OATS.

This grain, while paying well for good cultivation, can be raised with less labor than any other cereal crop, and will thrive on a great variety of soils. Where extra care is taken in preparing and enriching the land, the best and heaviest oats are produced on a clayey loam ; but, as a general rule, in this country, oats are raised on low, moist, rather mucky soils. Unlike barley, they succeed on sod-land. They are frequently sown on new, moist land, that would otherwise be planted with Indian corn. They require less labor in planting and cultivating than corn, and are sown to a considerable extent on this account.

In New York and Pennsylvania, which produce more than one-third of all the oats raised in the United States and Territories, oats are frequently sown on land intended for wheat, taking the place formerly occupied by a summer fallow. Where the land is rich enough, good wheat is often obtained after oats ; but, as a general rule, the oats are obtained at the expense of the succeeding wheat crop.

## INTRODUCTION.

## BARLEY.

*Bushels of barley produced in 1860.*

Ohio.....	1, 663, 868		
Oregon.....	26, 254		

The climate of the United States is not as well adapted to the production of barley as of wheat. Barley delights in a moist climate and an extended growing season. It is for this reason that English barley is superior to that of any other country. While we can raise wheat of a quality superior to that of England, our best barley would not be used by a London maltster.

Barley is now used in this country principally for beer-making purposes. With the rapid increase in our foreign population there is yearly an increased demand for barley, and the price has advanced much more than that of any other of our ordinary grain crops. Weight for weight, barley of late years has brought a higher price than wheat, and, where the soil and climate are well suited to its production, there are few crops more profitable. In favorable circumstances it is believed that three bushels of barley can be raised with as little expense as two bushels of wheat. Barley, of all ordinary crops, however, requires good culture. It is only on well-drained and highly cultivated farms that we can depend for raising good crops.

As compared with Indian corn, wheat, and oats, barley occupies a very subordinate position in American agriculture. In 1860 the total crop of the States and Territories was 15,825,898 bushels; while, in round numbers, there were 838,000,000 bushels of Indian corn, 173,000,000 bushels of wheat, and 172,000,000 bushels of oats. As compared with 1850, however, the increase in the production of barley has been greater than in any of these crops. In round numbers, the barley crop in 1850 was 5,000,000 bushels, and in 1860 15,000,000 bushels, or an increase of 200 per cent. This is

due principally, as before remarked, to the increased demand for barley for malting purposes, and the high price which, relatively to other crops, and to the expense of its cultivation, it commands in market.

The following table shows the amount of barley raised in the New England States in 1860 as compared with 1850:

	1860.	1850.
Connecticut.....	20, 813	19, 099
Massachusetts.....	134, 891	112, 385
Vermont.....	79, 211	42, 150
Rhode Island.....	40, 993	18, 875
New Hampshire.....	121, 103	70, 256
Maine.....	802, 108	151, 731
	<u>1, 199, 119</u>	<u>414, 496</u>

It will be seen that the crop has increased in every one of the New England States. In the aggregate there was nearly three times as much raised in 1860 as in 1850. The greatest increase is in Maine. More than five times as much was raised in this State in 1860 as in 1850.

The following table shows the amount of barley raised in the middle States in 1860 as compared with 1850:

	1860.	1850.
New York.....	4, 186, 667	3, 585, 059
Pennsylvania.....	530, 716	165, 584
New Jersey.....	24, 915	6, 492
Delaware.....	3, 646	56
Maryland.....	17, 350	745
District of Columbia.....	175	75
	<u>4, 753, 469</u>	<u>3, 758, 011</u>

The production of barley in each of the middle States has increased since 1850; but the increase is by no means equal to that in the New England States. New York produces over 85 per cent. of all the barley raised in the middle States. The increased per cent., however, in this State has been far less than in the other States. This, however, is due to the fact that, as compared with other States, her barley crop was so large in 1850. She produced over half a million bushels more barley in 1860 than in 1850, which is nearly as much as the total crop in the other middle States.

Pennsylvania, which raised thirteen million bushels of wheat in 1860, while New York raised only eight and a half million bushels, and twenty-eight million bushels of Indian corn to twenty million bushels in New York, produces only a little more than half a million bushels of barley, while New York produces over four million bushels.

The following table shows the amount of barley raised in the western States in 1860 as compared with 1850:

	1860.	1850.
Illinois.....	1, 036, 338	110, 795
Indiana.....	382, 245	45, 483
Iowa.....	467, 103	25, 093
Kansas.....	4, 716	.....
Kentucky.....	270, 685	95, 343
Michigan.....	307, 868	75, 249
Minnesota.....	109, 668	1, 216
Missouri.....	228, 502	9, 631
Ohio.....	1, 663, 868	354, 358
Nebraska.....	1, 108	.....
	<u>4, 472, 101</u>	<u>717, 168</u>

Western States, inclusive, produce but little more barley than the State of New York alone. Ohio produces more barley than any other western State. Illinois comes next. These two States produce about one million bushels more barley than all the other western States.

Though the aggregate production of barley in the western States is so small, the increase since 1850 has been very great. The crop of Illinois has increased eight hundred and fifty per cent. Iowa even more, or about eighteen hundred per cent. Missouri has increased still more rapidly, or nearly two thousand three hundred per cent.

The following table shows the amount of barley raised in the southern States in 1860 as compared with 1850:

	1860.	1850.
Alabama.....	15, 135	2, 958
Arkansas.....	3, 158	177
Florida.....	8, 309	.....
Georgia.....	14, 682	11, 501
Louisiana.....	224	.....
Mississippi.....	1, 875	228
North Carolina.....	3, 445	2, 735
South Carolina.....	11, 490	4, 583
Tennessee.....	25, 144	2, 737
Texas.....	67, 562	4, 776
Virginia.....	68, 846	25, 437
	<u>219, 930</u>	<u>56, 132</u>

The production of barley in the southern States is quite small. The single State of Maine alone produces four times as much barley as all the southern States. The increase, however, since 1850, is very decided, or over three hundred per cent. Virginia produces nearly one-third of all the barley raised in the southern States. Texas, Tennessee, Georgia, Alabama, and South Carolina are the principal southern barley-growing States; but even in these States the crop is very small.

The following table shows the amount of barley raised in the Pacific States in 1860 as compared with 1850:

	1860.	1850.
California.....	4, 415, 426	9, 712
Oregon.....	26, 254	.....
New Mexico.....	6, 099	5
Washington.....	4, 621	.....
Utah.....	9, 076	1, 799
	<u>4, 462, 376</u>	<u>11, 516</u>

California produces nearly all the barley raised in the Pacific States. It is a noteworthy fact, that this young State produces more barley than any other State in the Union. California and New York produce more barley than all the other States and Territories included.

The following table shows the amount of barley raised in different sections of the United States in 1860 and 1850, in proportion to the population:

	1860.	1850.
New England States.....	0.38	0.15
Middle States.....	0.54	0.56
Western States.....	0.43	0.11
Southern States.....	0.02	0.001
Pacific States.....	7.88	0.05
	<u>.....</u>	<u>.....</u>
United States and Territories.....	0.40	0.22

It will be seen that the production of barley in all the States more than keeps up with the increase in population. In fact the amount of barley raised to each person in 1860 was nearly twice as much as in 1850. It was more than double in the New England States; nearly four times as great in the western States, and about fifteen times as great in the Pacific States.

In the middle States alone, has the increase in the crop fallen below the increase in population.

## CULTURE OF BARLEY.

As before remarked, barley requires good cultivation. It delights in a warm, active, fertile soil. It does not do well on sod-land. In England it is usually sown on light, sandy soils, after a crop of turnips that have been eaten on the land by sheep. The droppings of the sheep enrich the land, while the small feet of the sheep consolidate the light, porous soil. In this country barley appears to flourish on heavier soils, especially if they are thoroughly pulverized. At all events the soil must be well drained and the crop sown in good season in the spring. Our season is so short, and the roots of barley extend, as compared with winter wheat, over such a small surface, that it is exceedingly important that the soil contain a liberal supply of plant-food in an active condition.

Winter barley is grown to a considerable extent in the southwestern States, and its cultivation is rapidly increasing in western New York, where it takes the place, to a certain extent, of winter wheat. Winter barley is heavier than spring barley, and commands a higher price. It is sown at the same time as winter wheat, and requires the same cultivation.

## BUCKWHEAT.

*Bushels of buckwheat produced in 1860.*

Ohio.....	2, 370, 650	Aggregate.....	17, 571, 818
Oregon.....	2, 749		

Buckwheat is an important crop in many sections of the United States. It has properties which render it peculiarly well suited to take the place it occupies among our grain crops. It is not botanically a cereal, but it affords a highly nutritious grain, which is used to a considerable extent as food for man and animals. It can be sown later in the season than any other grain-crop. In favorable seasons, and on good soil, the yield is very large. It is so rampant a grower that it smothers out weeds, and is frequently sown for this purpose. It is also grown as a green-crop for ploughing under as manure. Being sown so late in the season, it can be grown on land that is too wet for other crops. On the other hand, it succeeds well on rough, hilly land, where almost any other crop would perish.

The total production of buckwheat in the United States and Territories in 1840 was 7,291,743 bushels, in 1850 8,956,912 bushels, and in 1860 17,571,818 bushels. The crop of 1860 was nearly double what it was in 1850, showing a larger increase than any other grain-crop.

The following table shows the amount of buckwheat raised in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut.....	309,107	229,297
Maine.....	339,519	104,523
Massachusetts.....	123,202	105,895
New Hampshire.....	89,996	65,265
Rhode Island.....	3,573	1,245
Vermont.....	225,415	209,819
	<hr/> 1,090,812 <hr/>	<hr/> 716,044 <hr/>

There is a large increase in the crop of buckwheat in the New England States in 1860, as compared with 1850; but the crop of 1850 was less than in 1840, being 778,084 bushels in 1840, against 716,044 bushels in 1860.

The largest increase is in Maine. The crop of buckwheat in this State in 1840 was 51,543 bushels, in 1850 104,523 bushels, and in 1860 330,519 bushels.

Connecticut raised 303,043 bushels of buckwheat in 1840, 229,297 bushels in 1850, and 309,107 bushels in 1860. These fluctuations in the produce of buckwheat are doubtless caused by the season, as this crop is more dependent on the weather than any other.

The following table shows the amount of buckwheat raised in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York.....	5,126,307	3,183,955
New Jersey.....	817,386	878,934
Pennsylvania.....	5,572,024	2,193,692
Maryland.....	212,338	103,671
Delaware.....	16,355	8,615
District of Columbia.....	445	378
	<hr/> 11,744,865 <hr/>	<hr/> 6,369,245 <hr/>

In Pennsylvania and New York buckwheat is an important crop, and the above figures show that its cultivation is rapidly increasing. The crop has nearly doubled in these States since 1850. The grain is used extensively as food for sheep in winter, and there are few crops which for the labor attending it afford a better profit.

The following table shows the amount of buckwheat raised in the western States in 1860, as compared with 1850:

	1860.	1850.
Ohio.....	2, 370, 650	638, 000
Indiana.....	396, 989	149, 740
Michigan.....	520, 916	472, 917
Illinois.....	324, 117	184, 504
Wisconsin.....	38, 987	79, 878
Minnesota.....	28, 052	515
Iowa.....	215, 705	52, 516
Missouri.....	182, 292	23, 641
Kentucky.....	18, 928	16, 097
Kansas.....	41, 575	.....
Nebraska.....	12, 224	.....
	<u>4, 159, 435</u>	<u>1, 617, 864</u>

It will be seen that Ohio raises more buckwheat than all the other western States, and that the crop has rapidly increased since 1850.

Michigan raises the next largest crop of buckwheat, though but little more than one quarter of the amount raised in Ohio.

Indiana, Illinois, Iowa, and Missouri are evidently giving some attention to buckwheat, but it is a very subordinate crop in these great corn-growing States.

The following table shows the amount of buckwheat raised in the southern States in 1860 as compared with 1850:

	1860.	1850.
Virginia.....	478, 090	214, 898
North Carolina.....	35, 924	16, 704
South Carolina.....	602	283
Georgia.....	2, 023	250
Alabama.....	1, 347	348
Louisiana.....	160	3
Texas.....	1, 349	59
Mississippi.....	1, 099	1, 121
Arkansas.....	509	175
Tennessee.....	14, 451	19, 427
Florida.....	.....	55
	<u>536, 184</u>	<u>253, 323</u>

The crop of buckwheat has more than doubled in the southern States since 1850. It is, however, a very small crop in the south.

Virginia produces eight times as much as all the other southern States together. It is probable that the bulk of the crop is raised in western Virginia, where the agriculture assimilates closely to that of Pennsylvania and Ohio.

The following table shows the amount of buckwheat raised in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California.....	76, 887	.....
Oregon.....	2, 749	.....
New Mexico.....	6	100
Washington.....	707	.....
Utah.....	68	332
	<u>80, 417</u>	<u>432</u>

## INTRODUCTION.

In buckwheat, as in every other agricultural product, California shows rapid progress. It is clear, however, that this crop receives but little attention on the Pacific coast.

The following table shows the amount of buckwheat raised in the different sections of the United States in proportion to population :

	1860.	1850.
New England States.....	0.35	0.26
Middle States.....	1.41	0.96
Western States.....	0.41	0.25
Southern States.....	0.09	0.03
Pacific States.....	0.14	0.002
Whole United States and Territories.....	<u>0.56</u>	<u>0.38</u>

Buckwheat is one of the few crops that increases more rapidly in the United States than the population. In 1850 we raised in the whole United States and Territories about twelve quarts to each person, and in 1860 a little over half a bushel.

The middle States in 1850 raised nearly a bushel of buckwheat to each inhabitant, and in 1860 nearly a bushel and a half to each person.

The western States raise less than half a bushel to each person, and New England seven-twentieths of a bushel. The southern States raise only nine hundredths of a bushel to each inhabitant.

## PEAS AND BEANS.

*Bushels of peas and beans produced in 1860.*

STATES.	BUSHELS.	STATES.	BUSHELS.
Alabama.....	1, 482, 036	Pennsylvania.....	123, 090

New Jersey.....	27, 674		
New York.....	1, 609, 339	Total, Territories.....	60, 978
North Carolina.....	1, 932, 204		
Ohio.....	102, 511	Aggregate.....	15, 061, 995
Oregon.....	34, 407		

In 1850 there were raised in the United States 9,219,901 bushels of peas and beans. The amount was not given in the census of 1840. In 1860 there were raised 15,061,995 bushels, showing an increase of over 50 per cent.

Had the crops been returned separately it would have been more interesting. Though belonging to the same botanical order, (*Leguminosæ*), and of quite similar chemical composition, the crops are raised practically for very different objects. Beans are grown principally as food for man, while the pea is cultivated principally as food for animals on the farms, or for ploughing under as a green crop for manure.

With the exception of flax-seed and decorticated cotton-seed, peas and beans contain more nitrogen than any other grain. The droppings of animals fed on peas and beans are consequently more valuable than that from animals fed on any other grain.

The growth of these crops when fed out on the farm increases its fertility more than any other grain crop. When consumed on the farm, and the manure returned to the land, or when ploughed under as a manure, peas may be considered as a renovating crop. As a crop to alternate with wheat, peas are exceedingly useful. They tax the soil but lightly, and when a heavy crop is produced they smother the weeds. They also ripen early enough to afford ample time to sow wheat after the peas are harvested.

To a certain extent these remarks are applicable to beans. Their cultivation is rapidly extending in the wheat-growing districts. They can be planted late in the season, and yet can be harvested in time to allow the land to be sown to wheat. Being planted in rows, the land can be horsehoed and the soil cleaned and pulverized almost as well as if summer-fallowed.

The following table shows the amount of peas and beans raised in the New England States in 1860 as compared with 1850 :

	1860.	1850.
Connecticut.....	25, 864	19, 090
Maine.....	246, 915	205, 641
Massachusetts.....	45, 246	43, 709
New Hampshire.....	79, 454	70, 856
Rhode Island.....	7, 698	6, 846
Vermont.....	70, 654	104, 649
	<hr/> 475, 831	<hr/> 450, 691

Except in Vermont, the crop of peas and beans has increased in all the New England States since 1850.

Maine raises more peas and beans than all the other New England States. The total of these two crops in New England is less than half a million bushels.

The following table shows the amount of peas and beans raised in the middle States in 1860 as compared with 1850 :

	1860.	1850.
New York.....	1, 609, 339	741, 546
New Jersey.....	27, 674	14, 174
Pennsylvania.....	123, 090	55, 231
Maryland.....	34, 407	12, 816
Delaware.....	7, 438	4, 120
District of Columbia.....	3, 749	7, 754
	<hr/> 1, 805, 697	<hr/> 835, 641

New York raises eight-ninths of all the peas and beans produced in the middle States. The crop in this State has more than doubled since 1850.

## INTRODUCTION.

The following table shows the amount of peas and beans raised in the western States in 1860 as compared with 1850:

	1860.	1850.
Ohio.....	102,511	60,168
Indiana.....	79,902	35,773
Michigan.....	165,128	74,254
Illinois.....	108,028	82,814
Wisconsin.....	99,484	20,657
Iowa.....	41,081	4,775
Missouri.....	107,999	46,017
Kentucky.....	288,346	202,574
Minnesota.....	18,988	10,002
Kansas.....	9,827	.....
Nebraska.....	5,029	.....
	<u>1,026,323</u>	<u>537,434</u>

It will be observed that the whole western States do not produce as much peas and beans as the State of New York alone. Kentucky produces more than any other western State. Michigan comes next, and then Illinois, Missouri, and Ohio. But these crops are not raised to any considerable extent in the west.

During the present year (1864) the west has barely been able to supply the home demand for beans, and, to some extent at least, has imported them from the middle States and Canada.

The following table shows the amount of peas and beans raised in the southern States in 1860 as compared with 1850:

	1860.	1850.
Virginia.....	515,168	521,579
North Carolina.....	1,932,204	1,554,252
South Carolina.....	1,728,074	1,026,900
Georgia.....	1,765,214	1,142,011
Alabama.....	1,482,036	592,701
Louisiana.....	431,148	161,732
Texas.....	341,961	179,350
Mississippi.....	1,954,666	1,072,757
Arkansas.....	440,472	285,738
Tennessee.....	547,803	369,321
Florida.....	363,217	135,359
	<u>11,501,963</u>	<u>7,371,700</u>

The States and Territories raised about 9,000,000 bushels of peas and beans in 1850. Of these the southern States raised over 7,000,000 bushels. In 1860 the States and Territories raised about 15,000,000 bushels, and of these the southern States raised over 11,500,000 bushels.

As before said, we have no means of knowing how much of this quantity is peas and how much beans. In the northern States the proportion of beans is undoubtedly larger than in the southern States. The so-called "cow pea" of the south is more closely allied to the bean than to the pea family. It is, however, a most valuable plant in a climate sufficiently warm to mature it. It has done much for southern agriculture. Like all the leguminous plants, it contains a high percentage of nitrogen; and, when ploughed under as manure, or consumed on the farm by stock, it adds greatly to the fertility of the soil. It is the great renovating crop of the southern States. To a certain extent it is to the south what red clover is to the north. Within the past thirty years its cultivation has been greatly extended both as a green crop for ploughing under as manure and as a grain crop. Its importance in southern agriculture can hardly be overestimated. The great want of American agriculture is a plant which

shall occupy in our system of rotation the place which the turnip occupies in British agriculture. We have no such crop. The bean at the north has more of the necessary qualities than any other plant extensively cultivated. It is planted in rows, and admits the use of the horsehoe in cleaning the land. It does not draw heavily on the soil, and contains a large amount of nitrogen, the element which the cereals so much need. The "cow pea" has these qualities in a still greater degree. In the southern States it grows much more luxuriantly than the bean or the common pea at the north, and is the best plant that is extensively grown in southern agriculture for enriching the land.

The cow pea does not flourish north of Virginia, and even in that State some of the best varieties do not succeed as well as in the more southern States. It will be seen from the above table that North and South Carolina, Georgia, Alabama, and Mississippi raise the greatest amount of this crop. In Virginia the plant is grown extensively, but probably the larger proportion of it is ploughed under for manure.

The following table shows the amount of peas and beans raised in the Pacific States in 1860 as compared with 1850:

	1860.	1850.
California.....	165,674	2,292
Oregon.....	34,407	6,566
New Mexico.....	38,614	15,688
Washington.....	10,850	.....
Utah.....	2,535	289
	<hr/> 251,880	<hr/> 24,835

The cultivation of this crop is rapidly extending in the Pacific States. As will be seen from the following table, they increase four times as rapidly as the population.

The following table shows the amount of peas and beans raised in the different sections in 1860 and 1850, and in the whole United States and Territories in proportion to population:

	1860.	1850.
New England States.....	0.15	0.12
Middle States.....	0.21	0.12
Western States.....	0.10	0.13
Southern States.....	1.26	0.97
Pacific States.....	0.44	0.13
	<hr/>	<hr/>
United States and Territories.....	0.48	0.35

It will be seen that the increase in the production of peas and beans in all the States and Territories more than keeps up with the increase in population. It was eleven quarts to each inhabitant in 1850, and a little over fifteen quarts to each person in 1860.

In the New England States there were three and three-quarters quarts of peas and beans to each inhabitant in 1850, and four and three-quarters quarts in 1860.

In the middle States there were three and three-quarters quarts in 1850, and seven quarts in 1860.

In the western States there were four quarts in 1850, and only three quarts in 1860, showing a decrease in the production of peas and beans of 25 per cent. in proportion to population.

In the southern States there were nearly a bushel of peas and beans to each person in 1850, and over a bushel and a peck in 1860.

It will be observed that there is a decided increase in the production of these crops in all the different sections except at the west. The farmers on the rich land of this section have not yet realized

## INTRODUCTION.

the necessity of raising peas and beans as renovating crops, while viewed merely as grain crops, it is doubtless found that the cereal grains are more profitable.

## IRISH POTATOES

*Bushels of Irish potatoes produced in 1860.*

Vermont.....	5, 253, 498	4, 951, 014
Total.....	21, 343, 616	19, 618, 111

In Connecticut there is a great falling off in the production of this crop, while in Maine the crop has nearly doubled since 1850. There is a slight falling off in Massachusetts, New Hampshire, and Rhode Island.

Taking the New England States as a whole, the crop has increased from 19,618,111 bushels in 1850 to 21,343,616 bushels in 1860.

The following table shows the amount of Irish potatoes raised in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	26,447,394	15,398,368
Pennsylvania .....	11,687,467	5,980,732
New Jersey .....	4,171,690	3,207,236
Delaware .....	377,931	240,542
Maryland .....	1,264,429	764,939
District of Columbia .....	31,693	28,292
Total .....	<u>43,980,604</u>	<u>25,620,109</u>

The production of Irish potatoes has increased somewhat in all the middle States since 1850; but it is only in New York, Pennsylvania, and New Jersey that there is any marked increase. In New York the crop has risen from fifteen million bushels in 1850 to twenty-six million bushels in 1860; and in Pennsylvania the crop has increased from less than six million bushels in 1850 to over eleven and a half million bushels in 1860.

Taking the middle States as a whole, the crop of Irish potatoes has increased from about twenty-five and a half million bushels in 1850 to nearly forty-four million bushels in 1860.

The following table shows the quantity of Irish potatoes raised in the western States in 1860 as compared with 1850:

	1860.	1850.
Ohio .....	8,695,101	5,057,769
Indiana .....	3,866,647	2,083,337
Michigan .....	5,261,245	2,359,897

Wisconsin .....	3,818,309	1,402,077
Minnesota .....	2,565,485	21,145
Iowa .....	2,806,720	276,120
Missouri .....	1,990,850	939,006
Kentucky .....	1,756,531	1,492,487
Kansas .....	296,335	.....
Nebraska .....	162,188	.....
Total .....	<u>36,759,801</u>	<u>16,146,699</u>

Minnesota and Iowa show an enormous increase in the production of Irish potatoes since 1850, while all the western States show a decided gain in amount.

The crop has increased from a little over sixteen million bushels in 1850, to thirty-six and three quarter million bushels in 1860.

The following table shows the amount of Irish potatoes raised in the southern States in 1860 as compared with 1850:

	1860.	1850.
Virginia .....	2,292,398	1,316,933
North Carolina .....	830,565	620,318
South Carolina .....	226,735	136,494
Georgia .....	303,789	227,379

Louisiana .....	294,655	95,632
Texas .....	174,182	94,645
Mississippi .....	414,320	261,482
Arkansas .....	418,010	193,832
Tennessee .....	1,182,005	1,067,844
Florida .....	18,766	7,828
Total .....	<u>6,647,071</u>	<u>4,268,388</u>

## INTRODUCTION.

The State of Maine raises nearly as many Irish potatoes as all the southern States. Virginia and Tennessee raise more Irish potatoes than the other southern States combined. The crop decreases as we go south, while the sweet potato takes its place.

The following table shows the amount of Irish potatoes raised in the Pacific States in 1860 as compared with 1850:

	1860.	1850.
California .....	1, 789, 463	9, 292
Oregon .....	303, 319	91, 326
New Mexico .....	5, 223	3
Washington .....	163, 594	.....
Utah .....	141, 067	43, 968
Total .....	<u>2, 402, 600</u>	<u>144, 589</u>

The following table shows the quantity of Irish potatoes raised in the different sections of the United States in proportion to population:

	1860.	1850.
New England States .....	6.80	7.19
Middle States .....	5.28	3.88
Western States .....	3.58	2.66
Southern States .....	0.73	0.58
Pacific States .....	4.15	0.80
United States and Territories .....	3.53	2.83

It will be seen that New England raises more Irish potatoes in proportion to population than any other section. There is, however, a slight decrease in the crop in proportion to population since 1850, being a little over seven bushels to each person in 1850, and six and three-fourth bushels to each person in 1860.

In the middle States the crop has increased from three and three-fourth bushels in 1850 to five and one-fourth bushels in 1860, to each inhabitant.

In the western States the quantity of potatoes raised in proportion to population is far less than in the New England and middle States. In 1850 there were raised about two and a half bushels to each person, and in 1860 three and a half bushels.

In the Pacific States the production of Irish potatoes, in proportion to population, has increased enormously. In 1850 only about three-fourth bushel of potatoes were raised to each inhabitant; while in 1860 the crop exceeded four bushels to each person.

The whole United States and Territories raised about two and three-quarter bushels of potatoes to each inhabitant in 1850 and three and a half bushels in 1860.

Minnesota raises more potatoes, in proportion to population, than any other State in the Union. In 1850 she raised nearly four bushels to each person, and in 1860 nearly fifteen bushels.

Maine also raises a large crop of potatoes, in proportion to population. In 1850 she produced nearly six bushels to each person, and in 1860 over ten bushels.

Ohio .....	304, 445		

The crop of sweet potatoes in the States and Territories in 1850, was 38,268,148 bushels, and in 1860, 42,095,026 bushels. Taking all the States and Territories, there were 1.66 bushels of sweet potatoes raised in 1850 to each inhabitant, and in 1860 1.33 bushels. The great bulk of the crop is raised in the southern States.

The following table shows the amount raised in these States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	5, 439, 917	5, 475, 204
Arkansas .....	1, 566, 540	788, 149

Vermont .....	15,900,359	12,137,980	8,215,030	8,720,834
Total .....	51,485,519	43,924,006	21,620,906	27,119,778

The production of butter in the New England States, has, in round numbers, increased from less than forty-four million pounds in 1850, to over fifty-one million pounds in 1860. On the other hand, the production of cheese has *decreased* from over twenty-seven millions in 1850, to less than twenty-one and three-fourths millions in 1860.

Vermont produces more butter and also more cheese than any other New England State. Maine stands next in the production of butter, but produces less cheese than either Massachusetts, Connecticut, or New Hampshire.

The following table shows the amount of butter and cheese made in the middle States in 1860, as compared with 1850:

States.	BUTTER.		CHEESE.	
	1860.	1850.	1860.	1850.
New York .....	103,097,280	79,706,004	48,548,289	49,741,413
Pennsylvania .....	58,053,511	39,878,418	2,508,556	2,505,034

Total .....	179,179,870	134,008,062	51,253,938	52,620,895

The product of butter in the middle States has increased from one hundred and thirty-four million pounds in 1850, to one hundred and seventy-nine million pounds in 1860.

New York makes nearly one-fourth of all the butter made in the United States, and more than one-third of the cheese.

Pennsylvania comes next in the product of butter. She made over fifty-eight and a half million of pounds in 1860, against less than forty million in 1850. Although Pennsylvania, after New York, supplies more butter than any other State, she produces comparatively but little cheese.

The following table shows the amount of butter and cheese made in the western States in 1860, as compared with 1850:

States.	BUTTER.		CHEESE.	
	1860.	1850.	1860.	1850.

## INTRODUCTION.

Ohio is the principal dairy State of the west. She makes nearly one-third of all the butter produced in the western States, and over seventy-five per cent. of all the cheese.

Illinois stands second in the western States in the production of butter, making about twenty-eight million pounds in 1860, against twelve and a half million in 1850.

Indiana stands third among the western States, and produced over eighteen million pounds in 1860, against less than thirteen million in 1850.

Wisconsin shows a marked increase in this production. She has increased from three and a half million pounds in 1850, to thirteen and a half million pounds in 1860.

Minnesota shows even greater progress in butter-making. From eleven hundred pounds in 1850, she increased to nearly three million pounds in 1860.

The cheese product of the west is exceedingly small. Leaving out Ohio, the western States do not produce seven million pounds of cheese. Vermont produces more cheese than all the western States together, exclusive of Ohio.

The following table shows the amount of butter and cheese made in the southern States in 1860, as compared with 1850:

States.	BUTTER.		CHEESE.	
	1860.	1850.	1860.	1850.
Alabama .....	6,028,478	4,009,811	15,923	31,412
Arkansas .....	4,067,666	1,854,239	16,810	30,088
Florida .....	408,855	371,408	5,280	18,015
Georgia .....	5,439,705	4,640,569	15,587	46,976
Mississippi .....	5,006,610	4,346,234	4,427	21,191
Louisiana .....	1,444,743	683,069	6,153	1,957
North Carolina .....	4,735,405	4,146,290	51,119	95,921
South Carolina .....	3,777,934	2,981,850	1,543	4,970
Tennessee .....	10,017,787	8,139,585	135,675	177,681
Texas .....	5,850,583	2,344,900	275,128	95,290
Virginia .....	13,464,722	11,089,360	280,852	430,292
Total .....	59,642,527	44,606,394	808,397	959,802

The amount of butter made in the southern States has increased from forty-four and a half million pounds in 1850, to nearly sixty million pounds in 1860.

The cheese product in the southern States is exceedingly light, and has fallen off since 1850.

The following table shows the amount of butter and cheese made in the Pacific States in 1860, as compared with 1850:

States and Territories.	BUTTER.		CHEESE.	
	1860.	1850.	1860.	1850.
California .....	3,095,035	705	1,343,689	150
Oregon .....	1,000,157	211,464	105,379	36,980
New Mexico .....	13,259	111	37,340	5,848
Washington .....	153,092	.....	12,146	.....
Utah .....	316,046	83,309	53,331	30,998
Total .....	4,577,580	205,589	1,551,785	73,976

The production of butter, as of every other agricultural product, has advanced in California with astonishing rapidity. In 1850 only 705 pounds were produced; while in 1860 California produced over three million pounds of butter, and over one and a quarter million pounds of cheese. She made nearly sixty-eight per cent. more cheese than all the southern States.

The following table shows the amount of butter and cheese made in the different sections of the country in proportion to population :

	BUTTER.		CHEESE.	
	1860.	1850.	1860.	1850.
New England States .....	16.42	16.10	6.89	9.94
Middle States .....	21.50	16.08	6.15	7.94
Western States .....	16.08	14.33	2.78	3.92
Southern States .....	6.55	6.12	0.00	0.13
Pacific States .....	7.02	1.65	2.70	0.47
United States and Territories ..	14.62	13.51	3.29	4.11

It will be seen that the States and Territories raised about thirteen and a half pounds of butter to each inhabitant in 1850, and fourteen and five-eighths pounds in 1860, showing an increase of one and one-eighth pound to each person. In cheese, however, the production has not kept pace with the population. It has fallen off over three-fourths of a pound to each person. Cheese does not enter as largely into the dietary of the United States as in most other countries, and small as is the amount produced—less than four pounds to each inhabitant—it more than meets the demand, leaving a considerable balance for exportation.

The production of butter in the New England States more than keeps pace with the increase in population. Over sixteen pounds of butter is produced to each person.

In the middle States twenty-one and a half pounds of butter is made to each person. In 1850 it was only sixteen pounds, showing a very remarkable increase.

The western States produced about fourteen pounds to each person in 1850, and sixteen pounds in 1860, also showing a decided increase.

In the southern States, too, the production of butter keeps pace with the population. The amount made, however, is small, only six and a half pounds to each inhabitant.

The Pacific States, which produced only a little over one and a half pound of butter to each person in 1850, produced nearly eight pounds in 1860.

In cheese, all the different sections, with the exception of the Pacific States, show a marked decline as compared with population. The New England States, which produced nearly ten pounds of cheese to each inhabitant in 1850, produces less than seven pounds in 1860. It will be observed, however, that New England still produces more cheese in proportion to population than any other section.

The middle States have fallen off from nearly eight pounds of cheese to each person in 1850, to about six pounds in 1860.

The Pacific States have increased their cheese product from less than half a pound to each person in 1850, to nearly three pounds in 1860.

Since the census was taken, the production of cheese, especially in the great dairy districts of New York, has greatly increased. The "cheese factory" system which was introduced a few years ago has been stimulated into an astonishing development by the high price of cheese caused by the high premium on gold and sterling exchange. The cheese made in these factories is generally of better quality than that hitherto made in private dairies, and pains have been taken to adapt it to the wants of the European market. The cheese is sent to England, and, being sold for gold, the price in this country increases with the premium on gold and sterling exchange. At the time of this writing, (November, 1864,) cheese in New York sells for twenty-two cents per pound. In 1859 the highest price of cheese in New York at the same period was eleven cents per pound; in 1860 eleven and a half cents, and in 1861 seven and a half cents. Cheese is now more than double the average price obtained before the war. The effect of these high prices, as we have before remarked, is seen in the increased atten-

## INTRODUCTION.

tion paid to the manufacture of cheese, and especially to the general introduction of the "factory system."

The leading idea of the factory system is this: Farmers with a few cows, to avoid the expense of the necessary buildings, and to introduce the best apparatus for the manufacture of cheese, unite to send their milk every morning to a certain point, where it is converted into cheese, and each farmer receives his proportion (or the money received for it) according to the quantity of milk he has furnished.

At the factory a competent person is employed to attend to the business, and the cheese is made on the most approved principles. Hitherto the system has worked to the mutual advantage of all concerned. Whether it will be found to work equally well when cheese falls to its normal price (or about half what it brings at present) remains to be seen.

WOOL.

*Pounds of wool produced in the United States in 1860.*

STATES.	POUNDS.	STATES.	POUNDS.

Vermont .....	3, 118, 960	3, 400, 717
Total .....	<u>6, 573, 064</u>	<u>7, 085, 509</u>

In 1850 there were over 7,000,000 pounds of wool produced in the New England States, and 6,500,000 pounds in 1860, showing a decrease of 500,000 pounds.

Vermont raised nearly half the wool produced in the New England States. From 1850 to 1860, however, the amount of wool produced in this State has fallen off more than 275,000 pounds.

Maine stands next, in the New England States, to Vermont, as a wool-growing State. In 1850 she produced 1,364,034 pounds of wool, and 1,495,060 pounds in 1860, showing an increase of over 100,000 pounds.

New Hampshire stands third, and in this State, also, there is a slight increase from 1850 to 1860.

In Massachusetts, Connecticut, and Rhode Island, as well as in Vermont, the produce of wool has fallen off since 1850.

The following table shows the amount of wool raised in the middle States in 1860 as compared with 1850:

	1860.	1850.
New York .....	9, 454, 474	10, 071, 301
New Jersey .....	349, 250	375, 396
Pennsylvania .....	4, 722, 522	4, 481, 570
Maryland .....	491, 511	477, 438
Delaware .....	50, 201	57, 768
District of Columbia .....	100	525
Total .....	<u>15, 098, 058</u>	<u>15, 463, 998</u>

This is a falling off in the amount of wool produced in the middle States since 1850 of nearly 375,000 pounds.

New York produces about two-thirds of all the wool grown in the middle States. In 1850 she produced 10,071,301 pounds, and 9,454,474 pounds in 1860, or over 500,000 pounds less than in 1850.

Pennsylvania produced 4,486,570 pounds in 1850, and 4,752,522 pounds in 1860, or an increase of over 250,000 pounds.

The following table shows the amount of wool grown in the western States in 1860, as compared with 1850:

	1860.	1850.
Ohio .....	10, 608, 927	10, 196, 371
Indiana .....	2, 552, 318	2, 610, 287
Michigan .....	3, 960, 888	2, 043, 283
Illinois .....	1, 989, 567	2, 150, 113
Wisconsin .....	1, 011, 933	253, 963
Minnesota .....	20, 388	85
Iowa .....	660, 858	373, 598
Missouri .....	2, 069, 778	1, 627, 164
Kentucky .....	2, 329, 105	2, 297, 433
Kansas .....	24, 746	.....
Nebraska .....	3, 302	.....
Total .....	<u>25, 231, 810</u>	<u>21, 652, 697</u>

In 1850 the western States produced 21,552,597 pounds of wool, and 25,231,810 pounds in 1860, or an increase of nearly 4,000,000 pounds. Ohio is the greatest wool-growing State in the west. She produced over ten and a half million pounds in 1860, or about half a million pounds more than in 1850.

Michigan is the next largest wool-growing State in the west. She produced about 4,000,000 pounds in 1860, against 2,000,000 in 1850.

Indiana stands third, producing two and a half million pounds, showing a very slight decrease since 1850.

Kentucky stands fourth, with a small increase since 1850.

Missouri and Illinois come next, the former representing an increase of twenty-five per cent., while the latter shows a small decrease since 1850.

The following table shows the amount of wool grown in the southern States in 1860, as compared with 1850 :

	1860.	1850.
Virginia .....	2,610,019	2,860,765
North Carolina .....	883,473	970,738
South Carolina .....	427,102	487,233
Georgia .....	946,227	990,019
Alabama .....	775,117	657,118
Louisiana .....	290,847	109,897
Texas .....	1,493,738	131,917
Mississippi .....	665,959	559,619
Arkansas .....	410,382	182,595
Tennessee .....	1,405,236	1,364,378
Florida .....	59,171	23,247
Total .....	<u>9,867,271</u>	<u>8,337,526</u>

It will be seen that the production of wool in the southern States increased from 8,337,526 pounds in 1850, to 9,867,271 pounds in 1860.

Virginia, Texas, and Tennessee are the largest wool-growing States in the south. In Texas the production of wool increased from 131,917 pounds in 1850, to 1,493,738 pounds in 1860.

The following table shows the amount of wool grown in the Pacific States in 1860, as compared with 1850 :

	1860.	1850.
California .....	2,683,109	5,520
Oregon .....	219,012	29,686
New Mexico .....	492,645	32,901
Washington .....	19,819	.....
Utah .....	74,765	9,222
Total .....	<u>3,489,350</u>	<u>77,329</u>

The increase in the Pacific States is enormous. From 77,329 pounds in 1850, the production of wool in these States increased to 3,489,350 pounds in 1860.

California, it is thought, will soon be one of the largest wool-producing States in the United States. Indeed, Ex-Governor Downey writes this office under date of June 4, 1863, "We must have now nearly 3,000,000 head of sheep in California, and the quality of the wool is annually improving. From the mildness of our climate, and richness of pasture, our State will show at the next census a wool product equal to that of the whole United States at present."

# INTRODUCTION.

lxxxix

The following table shows the amount of wool produced in the different sections of the United States in 1850 and 1860, as compared with population:

	1850.	1860.
New England States.....	2.09	2.59
Middle States.....	1.81	2.33
Western States.....	2.46	3.41
Southern States.....	1.08	1.01
Pacific States.....	6.04	0.43
United States and Territories.....	1.92	2.26

It will be seen that the Pacific States is the only section in which the production of wool has more than kept pace with the population. These States have increased from less than half a pound of wool to each person in 1850, to over six pounds in 1860.

In all the other sections the production of wool in proportion to population has decreased since 1850, excepting the southern States, where there is a slight increase.

The New England States stand next as wool-producers; but here, too, the growth of wool does not keep pace with the increase in population. It was 2.59 pounds to each person in 1850, and only 2.09 pounds in 1860.

In the middle States the growth of wool in 1850 was 2.33 pounds to each person, and in 1860 only 1.81 pound.

Leaving out the Pacific States, the highest production of wool in proportion to population was in the western States. It has fallen off, however, from 3.41 pounds in 1850 to 2.46 pounds in 1860.

In the southern States the growth of wool to each person was 1.01 pound in 1850, and 1.08 pounds in 1860, showing an increase of about one ounce to each inhabitant.

Taking all the States and Territories, the amount of wool raised in 1850 was a little over two and a quarter pounds to each inhabitant and in 1860 less than two pounds.

## FLAX.

North Carolina.....	593,796	216,490			

## INTRODUCTION.

The amount of flax produced in the States and Territories in 1850 was 7,709,676 pounds, and in 1860 4,720,145 pounds. In other words, the production of flax has fallen off almost one half since 1850.

Since the commencement of the war flax culture has received increased attention, owing to the scarcity of cotton, and it is not improbable that, were the census taken now, it would be found that the flax crop was at least as great as in 1850. The climate of the northern States is admirably adapted to the growth of flax, and all that is needed to make it a highly remunerative crop is the introduction of machines for dressing the fibre and preparing it for market. Great improvements have recently taken place in the machines for this purpose, and there can be no doubt that flax will be much more extensively cultivated.

The following table shows the amount of flax grown in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut .....	1, 187	17, 928
Maine .....	2, 997	17, 081
Massachusetts .....	265	1, 162
New Hampshire .....	1, 347	7, 652
Vermont .....	7, 007	20, 852
Rhode Island .....	.....	85
Total .....	<u>12, 703</u>	<u>64, 760</u>

The amount of flax raised in the New England States has fallen off from 64,760 pounds in 1850, to 12,703 pounds in 1860.

Vermont is the largest flax-producing State in New England, but even in this State the crop has fallen off from 20,852 pounds in 1850, to 7,007 pounds in 1860.

The following table shows the amount of flax grown in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	1, 518, 025	940, 577
New Jersey .....	48, 651	182, 965
Delaware .....	8, 112	11, 174
Maryland .....	14, 481	35, 656
Pennsylvania .....	312, 368	530, 307
Total .....	<u>1, 901, 637</u>	<u>1, 700, 709</u>

In New York the crop of flax increased from 940,577 pounds in 1850, to 1,518,025 pounds in 1860.

In Pennsylvania, on the other hand, there was a falling off in the production of flax from 530,307 pounds in 1850, to 312,368 pounds in 1860.

In New Jersey, Delaware, and Maryland, the crop of flax has also decreased since 1850.

The following table shows the amount of flax produced in the western States in 1860, as compared with 1850:

	1860.	1850.
Ohio .....	882, 423	446, 932
Indiana .....	97, 119	584, 469
Michigan .....	4, 128	7, 152
Illinois .....	48, 235	160, 063
Wisconsin .....	21, 644	68, 393
Minnesota .....	1, 983	.....
Iowa .....	30, 226	62, 660
Missouri .....	109, 837	627, 160
Kentucky .....	728, 234	2, 100, 116
Kansas .....	1, 135	.....
Nebraska .....	.....	.....
Total .....	<u>1, 924, 964</u>	<u>4, 056, 945</u>

It will be seen that there is a great falling off in the production of flax in the western States, where over four million pounds of flax was raised in 1850, and less than two million pounds in 1860.

Kentucky, in 1850, was decidedly the largest flax-producing State in the country, raising nearly one-third of all the flax grown in the United States. The returns for 1860 show an astonishing diminution in the growth of flax in this State. From over two million pounds in 1850, the production of flax is less than three-quarters of a million in 1860.

Ohio is now the largest flax-producing State in the west. From 446,932 pounds in 1850, she has increased to 882,423 pounds in 1860.

On the other hand, Indiana and Missouri, which produced a large crop of flax in 1850, have, like Kentucky, fallen off to an astonishing degree. Missouri, which produced 627,160 pounds in 1850, now produces only 109,837 pounds; and Indiana, which produced 584,469 pounds in 1850, produces only 97,119 pounds.

The following table shows the amount of flax grown in the southern States in 1860, as compared with 1850:

	1850.	1860.
Alabama.....	111	3,921
Arkansas.....	3,821	12,291
Florida.....		50
Georgia.....	3,303	5,387
Louisiana.....		
Mississippi.....	50	665
North Carolina.....	216,490	593,796
South Carolina.....	344	333
Tennessee.....	164,294	368,131
Texas.....	115	1,048
Virginia.....	487,808	1,000,450
Total.....	<u>876,336</u>	<u>1,986,072</u>

The production of flax in the southern States has fallen off more than one-half since 1850.

Virginia is the principal flax-producing State in the south. She raises more flax than all the other southern States. The amount of flax raised in Virginia has fallen off from one million pounds in 1850, to less than half a million pounds in 1860.

North Carolina and Tennessee are the only other southern States in which flax is grown to any extent.

The following table shows the amount of flax grown in the Pacific States in 1860, as compared with 1850:

	1850.	1860.
California.....		
Oregon.....	162	640
New Mexico.....		
Utah.....	4,343	550
Washington.....		
Total.....	<u>4,505</u>	<u>1,190</u>

In California there was no flax reported either in 1850 or 1860.

In Oregon there was produced 640 pounds in 1850, and only 162 pounds in 1860.

In Utah the production of flax increased from 550 pounds in 1850, to 4,343 pounds in 1860.

The following table shows the amount of flax in ounces grown in the different sections in 1860 and in 1850 in proportion to population:

	1860.	1850.
New England States.....	0.06	0.33
Middle States.....	3.68	4.25
Western States.....	3.00	10.29
Southern States.....	1.52	4.09
United States and Territories.....	2.37	5.31

# INTRODUCTION.

xciii

The high price of linseed oil, as well as of linseed oil-cake during the war, will doubtless stimulate the growth of flax for seed as well as for the fibre. American oil-cake finds a ready market in England at high prices; but it would seem that so valuable a food might be used on our own farms with decided advantage. It is not only highly nutritious for cattle and sheep, but the manure derived from the animals eating it is more than twice as valuable as that from animals fed on Indian corn. Our farmers have not yet learned to appreciate the full value of manures, and it is rare that the question of the relative value of manures from different foods is taken into consideration in determining what particular sustenance it is best to give our farm stock.

In this connexion we would call particular attention to the following table prepared by John B. Lawes, the well-known English scientific agriculturist, showing the value of manure made from a ton (2,000 pounds) of different foods:

Description of food.	Value.	Description of food.	Value.
1. Decorticated cotton-seed cake.....	\$27 86	14. Malt.....	\$6 65
2. Rape cake.....	21 01	15. Barley.....	6 32
3. Linseed cake.....	19 72	16. Clover hay.....	9 64
4. Malt dust.....	18 21	17. Meadow hay.....	6 43
5. Lentils.....	16 51	18. Oat straw.....	2 90
6. Linseed.....	15 65	19. Wheat straw.....	2 68
7. Tares.....	15 75	20. Barley straw.....	2 25
8. Beans.....	15 75	21. Potatoes.....	1 50
9. Peas.....	13 38	22. Mangolds.....	1 07
10. Locust beans.....	4 81	23. Swedish turnips.....	91
11. Oats.....	7 40	24. Common turnips.....	86
12. Wheat.....	7 08	25. Carrots.....	86
13. Indian corn.....	6 65		

This table deserves to be profoundly studied by every farmer. Mr. Lawes has been engaged for many years in experiments on this subject, and we have no doubt that the table correctly states the *relative* value of the manures obtained from the different foods; that is to say, if the manure obtained from the consumption of a ton of meadow hay is worth \$6 43, that made from a ton of clover hay is worth \$9 64, or half as much again; and this is true everywhere. The estimates are based on the value of manure in England, and are undoubtedly correct; but of course the figures are only true relatively where manures of all kinds are of less value, as is the case in the newer sections of this country.

It will be seen that the manure made from a ton of linseed cake is estimated at \$19 72; while from a ton of Indian corn it is estimated at only \$6 65.

It must be borne in mind that these are *gold* values. At the present time the value of the manures in our currency would be more than doubled. If these few remarks should be the means of calling the attention of American farmers to this important branch of rural economy much good will be accomplished.

## COTTON.

The amount of ginned cotton raised in the United States in 1860 was 5,387,052 bales, of 400 pounds each, or 2,154,820,800 pounds.

In 1850 there was 2,445,793 bales of cotton raised in the United States, or less than half the amount produced in 1860.

## INTRODUCTION.

The following table will show the amount of ginned cotton, in bales of 400 pounds each, raised in the different States in 1860, and also in 1850:

	1860.	1850.		1860.	1850.
Mississippi .....	1,202,507	484,292	Missouri .....	41,188	.....
Alabama .....	989,955	564,429	Virginia .....	12,727	3,947
Louisiana .....	777,738	178,737	Illinois .....	1,482	.....
Georgia .....	701,840	499,091	Utah .....	136	.....
Texas .....	431,463	58,072	Kansas .....	61	.....
Arkansas .....	367,393	65,344	New Mexico .....	19	.....
South Carolina .....	353,412	300,901			
Tennessee .....	296,464	194,532	Total .....	5,387,052	2,445,703
North Carolina .....	145,614	50,545			
Florida .....	65,153	45,131			

We have here omitted a few States which produced small quantities of cotton in 1850, but which are unreported in 1860. But the total amount is given correctly.

Mississippi produces more cotton than any other State. This State alone raised nearly half as much cotton in 1860 as the whole United States in 1850.

Alabama comes next, and then Louisiana, Georgia standing fourth, though but little behind her sister States.

These four States, Mississippi, Alabama, Louisiana, and Georgia, produced 3,672,040 bales of cotton, while all the other States produced only 1,715,012 bales.

Texas, Arkansas, and South Carolina come next in the order named.

Tennessee and North Carolina stand eighth and ninth; the two together, however, produce less cotton than the new State of Texas.

## RICE.

*Pounds of rice produced in the United States in 1860.*

# INTRODUCTION.

xcv

The cultivation of rice is confined to a very few States. South Carolina and Georgia produced in 1860 171,608,180 pounds; and the total product of all the States was only 187,167,032 pounds. In 1850 these same States produced still more—the two together giving 198,881,304 pounds; but the production of rice was greater in 1850 than in 1860 in nearly all the States, making the total 215,313,497 pounds. Of this, South Carolina in 1850 produced 159,930,613 pounds, and in 1860 119,100,528 pounds. Mississippi, which in 1860 produced only 809,082 pounds, in 1850 raised 2,719,856 pounds; and Alabama decreased still more, producing 2,312,352 pounds in 1850, and only 493,465 pounds in 1860. Florida, in 1850, produced 1,075,090 pounds; but in 1860 only 223,704. The only States that increased in production, were Georgia, North Carolina, and Louisiana.

## HOPS.

*Pounds of hops produced in the United States in 1860.*

STATES.	POUNDS.	STATES.	POUNDS.
Alabama .....	507	Oregon .....	493
Arkansas .....	146	Pennsylvania .....	43,191

Minnesota .....	132	Nevada .....	
Mississippi .....	248	New Mexico .....	
Missouri .....	2,265	Utah .....	545
New Hampshire .....	130,428	Washington .....	44
New Jersey .....	3,722		
New York .....	9,671,931	Total, Territories .....	645
North Carolina .....	1,767		
Ohio .....	27,533	Aggregate .....	10,991,996

The total production of hops in the United States in 1850 was 3,497,029 pounds; and in 1860 10,991,996 pounds, showing a remarkable increase in the cultivation of this crop.

New York produces nearly all the hops raised in the United States. In 1850 this State produced over two and a half million pounds, while all the other States and Territories produced less than one million pounds; and in 1860 New York produced over nine and a half million pounds, while all the other States and Territories produced less than one and a half million pounds.

Next to New York, Vermont raises more hops than any other State, producing 638,677 pounds in 1860, against 288,023 pounds in 1850.

In this country, as in England, the cultivation of hops is confined to a comparatively small area. New York raises over eight-tenths of all the hops produced in the United States; and in this State

## INTRODUCTION.

the bulk of the crop is raised in a few counties. The county of Otsego produces 3,507,069 pounds; Madison, 1,520,657 pounds; Schoharie, 1,441,648 pounds; Oneida, 838,460 pounds; Herkimer, 707,910 pounds; Montgomery, 515,584 pounds. These six counties in New York produce over eight and a half million pounds of hops, out of a total crop of eleven millions in the States and Territories.

## TOBACCO.

*Pounds of tobacco produced in the United States in 1860.*

The amount of tobacco raised in the States and Territories in 1850 was 199,752,655 pounds; and in 1860 434,209,461 pounds, showing an increase of nearly 220 per cent.

Of this amount Virginia produced in 1860 123,968,312 pounds, and Kentucky 108,126,840 pounds. In other words, these two States produced in 1860 more than half the tobacco grown in the United States.

In 1850 Virginia raised 56,803,227 pounds, and Kentucky 55,501,196 pounds, or 112,304,423 pounds together. In other words, in 1850, out of a total product of tobacco of less than two hundred million pounds in the States and Territories, these two States produced over one hundred and twelve million. It will be seen, too, that the increase in the crop of tobacco in these two States since 1850 is over 100 per cent., which, considering the magnitude of the crop in 1850, is very remarkable.

## INTRODUCTION.

xvii

The following table shows the quantity of tobacco grown in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut .....	6,090,133	1,267,624
Maine .....	1,583	.....
Massachusetts .....	3,233,198	138,246
New Hampshire .....	18,581	50
Rhode Island .....	705	.....
Vermont .....	12,245	.....
Total .....	<u>9,266,445</u>	<u>1,405,920</u>

In 1850 the amount of tobacco raised in the New England States was less than one and a half million pounds, while in 1860 it was over nine and a quarter million pounds—an increase of over 500 per cent.

Of the nine and a quarter million pounds raised in the New England States, Connecticut produced six million, and Massachusetts over three and one-fifth million.

The following table shows the amount of tobacco grown in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	5,764,582	83,189
New Jersey .....	149,485	310
Pennsylvania .....	3,181,586	912,651
Maryland .....	38,410,965	21,407,497
Delaware .....	9,699	.....
District of Columbia .....	15,200	7,900
Total .....	<u>47,531,517</u>	<u>22,411,447</u>

Maryland produced nearly twenty-one and a half million pounds of tobacco in 1850, while all the other middle States produced only about one million pounds. In 1860 this State produced nearly thirty-eight and a half million pounds, while the other middle States produced over nine million. New York and Pennsylvania show a remarkable increase in the tobacco crop. New York has increased from 83,189 pounds in 1850, to over five and three-fourth million pounds in 1860. The increase in Pennsylvania is by no means so great, but is nevertheless quite striking.

The following table shows the amount of tobacco raised in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	232,914	164,990
Arkansas .....	989,980	218,936
Florida .....	828,815	998,614
Georgia .....	919,318	423,924
Mississippi .....	159,141	49,960
North Carolina .....	32,853,250	11,984,786
South Carolina .....	104,412	74,285
Louisiana .....	39,940	26,878
Tennessee .....	43,448,097	20,148,932
Texas .....	97,914	66,897
Virginia .....	123,968,312	56,503,227
Total .....	<u>203,642,093</u>	<u>90,961,429</u>

Virginia, Tennessee, and North Carolina are the three principal tobacco-growing States in the south. These three States produce two hundred million pounds of the two hundred and three and a half million pounds raised in the southern States.

## INTRODUCTION.

The following table shows the amount of tobacco raised in the western States in 1860, as compared with 1850:

	1860.	1850.
Illinois .....	6,885,262	841,394
Indiana .....	7,993,378	1,044,620
Iowa .....	303,168	6,041
Kansas .....	20,349	.....
Kentucky .....	108,126,840	55,501,196
Michigan .....	121,099	1,245
Missouri .....	25,086,196	17,113,784
Ohio .....	25,092,581	10,454,449
Wisconsin .....	87,340	1,268
Minnesota .....	38,938	.....
Nebraska .....	3,636	.....
Total .....	<u>173,758,787</u>	<u>84,963,997</u>

Next to Kentucky, Ohio and Missouri are the greatest tobacco-growing States in the west. The crop has also increased largely in these States since 1850. Indiana and Illinois come next, the former producing nearly eight million pounds, and the latter nearly seven million pounds.

The following table shows the amount of tobacco grown in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California .....	3,150	1,000
Oregon .....	405	325
New Mexico .....	7,044	8,467
Utah .....	.....	70
Washington .....	10	.....
Total .....	<u>10,609</u>	<u>9,862</u>

But little tobacco is raised on the Pacific coast, and it has increased a mere trifle since 1850. In fact, in New Mexico there is an actual decrease, which is true of no other State except Florida.

The returns show that tobacco is raised in every State, and in all the Territories except Dakota.

In 1850 the amount of tobacco raised in all of the States and Territories was eight pounds to each inhabitant, and in 1860 about fourteen pounds. The unsettled condition of Kentucky since the commencement of the war, with the loss of almost the entire crop in Virginia, have caused a great diminution in the supply of tobacco, and prices have advanced very rapidly. This has stimulated the cultivation of tobacco in the northern States to an extent which it never would have attained in ordinary circumstances.

The principal variety of tobacco grown in the northern States is the Connecticut seed-leaf. It is ordinarily grown for cigar wrappers, and the larger and more perfect the leaf the more profitable is the crop. For smoking or chewing it is an inferior variety. In fact, it seems almost impossible to grow a good quality of chewing-tobacco in the northern States. It is found much more profitable to grow a large, tough leaf, suitable for cigar wrappers, than to attempt to grow a smaller crop of better quality.

The total amount of cane sugar produced in the United States in 1850 was 236,814,000 pounds; and in 1860, 230,982,000 pounds, showing a slight decrease in the last decade.

## INTRODUCTION.

Louisiana produces over two hundred and twenty-one million of the two hundred and thirty million pounds raised in the whole United States.

Texas produced over five million pounds of cane sugar in 1860, being the greatest sugar-growing State after Louisiana.

Of maple sugar there was produced in 1850, in the whole United States and Territories, 34,253,436 pounds; and in 1860, 40,120,205 pounds, or an increase of nearly six million pounds.

Of this amount New York and Vermont produced more than half; the former producing nearly eleven million pounds, and the latter nearly ten million pounds.

Michigan stands third, producing four million pounds. Ohio produces over three millions; Pennsylvania two and three quarter millions; New Hampshire two and a quarter millions; Wisconsin and Indiana each one and a half million; Massachusetts and Virginia about one million pounds each. For the amount raised in the other States we would refer to the foregoing table.

The article known as maple sugar is made from the sap of the *Acer Saccharinum*, or sugar maple, (known also as rock maple,) one of the most symmetrical and beautiful of American forest trees. It is found in nearly every State of the Union, but is most abundant between the parallels of 43° and 46°. The process of making the sugar may be briefly described as follows: As soon as the sap begins to flow in the spring, which is usually from the 1st to the 15th of March, the trees are "tapped" by boring one or two holes of half an inch in diameter and two inches deep, in each tree, and from fifteen to twenty-four inches above the ground. Into these holes are inserted hollow wooden plugs, called "quills," which conduct the sap into wooden troughs or pails placed beneath. Sometimes the orifice is made with a heavy, curvilinear chisel, which is driven into the sap-wood with a wooden mallet, and a wooden spout, properly prepared, is inserted to carry off the sap. The careless use of the axe in tapping, is frequently indulged to the great injury of the trees and to their premature destruction. The sap, ordinarily, runs only in the day-time and after frosty nights, commencing as soon as it begins to thaw in the morning, and ceasing as soon as it begins to freeze towards evening. Each tree will yield from one to four gallons of sap in twenty-four hours. Cold and dry winters, with frosty nights and warm, sunny days during the "sugaring season," are most favorable for the production of sap. The sap is collected from the troughs and placed in sheet-iron pans of about eight inches deep, four feet wide and eight to twelve feet long, set on brick arches, (kettles were formerly used for the purpose.) A brisk boiling is kept up in the pans for twelve or fifteen hours, fresh sap being occasionally added, when the whole reaches the consistency of "sirup," in which form much of it is used for domestic purposes. The sirup is then strained and put in kettles holding from eight to ten gallons each, where it is again kept boiling for about two hours. (The best makers pour into each kettle-full of sirup about one pint of new milk to assist in clarifying.) During this process the impurities rise to the surface and are carefully skimmed off. When the sirup has boiled sufficiently to "grain" well, it is allowed to partially cool, (stirring constantly,) and is then poured into pans or moulds, when it becomes the "maple sugar" of commerce. On the average, twenty quarts of sap will make one pound of sugar, and each tree will produce from three to four pounds of sugar annually. Very large trees will produce eight to ten pounds. The sugaring season usually lasts from four to six weeks, and until the buds of the tree begin to swell vigorously, when the sap diminishes in quantity and quality.

Of sorghum molasses the product was 6,749,123 gallons.

It is an interesting fact, as showing how rapidly a plant can be distributed through the country, that we have returns of sorghum molasses from twenty-eight out of the thirty-four States reported.

The high price of sugar and molasses since the war has stimulated the cultivation of sorghum to an unusual degree. The drought of 1863 in the west, followed by an unusually severe frost before the plants were ripe, destroyed the sorghum crop of 1863. Had the season been favorable, a large

amount of sorghum molasses would have been produced, as there was a larger area planted than ever before. The disastrous effect of the drought and early frost served to discourage many from planting in 1864 who would otherwise have engaged in the business.

Sugar has not been made to any extent from sorghum, and thus far the difficulties in the way of its manufacture, adverted to in our previous reports, have not been overcome.

#### BET SUGAR.

Within the last three years the price of sugar has doubled, and it is not improbable that the present high price will be maintained for some time to come.

Many trials have been made to manufacture an indigenous sugar, but, unhappily, the experiments have not been made to any extent on the proper vegetable. The sorghum has been tried and proves valuable for sirup, but the great difficulty in making sugar has not been overcome, and the high price, of this article continues.

We have been surprised that the cane has not yet been, to some extent, supplanted by the beet which involves no trials for experiments, as this plant has been cultivated successfully for a long period in France for this purpose, and the products obtained cannot be rivalled in beauty or exceeded in quality by the product of the cane.

The attempts which have been made to manufacture sugar from beets in this country have, as a general rule, till a year or two past, proved unsuccessful, probably owing to the fact that the experiments were tried on a small scale, with the rudest machinery. In France it is found that individual farmers cannot successfully manufacture sugar from the beet. It is properly a manufacturing, and not an agricultural process, one requiring a larger capital than most farmers are willing to invest. The better method would be to establish factories and encourage farmers to raise the beets at established prices per ton. In this way, with improved machinery, and the adoption of the more recent processes of manufacture, we see no reason why beet sugar cannot be produced in this country with great profit and advantage both to the manufacturers and the farmers. The climate of the southern and western States is well adapted to the growth of the beet, and as large crops can be grown here as in France. M. de Lavergne, in his recent work on French agriculture, states that the average production of beet-roots in the department of the Nord (where nearly half of all the sugar made in France is produced) is sixteen tons per acre. By actual trial it has been found that 120,000 pounds of beet-root will produce 8,400 pounds of sugar, or seven per cent., and 5,030 pounds of molasses. At this rate an acre of beets of sixteen tons would make 2,240 pounds of sugar, besides molasses.

The industry of beet sugar, so far as concerns the vegetable, is essentially agricultural, and this country would appear to combine all the conditions of success.

Beet-root sugar was formerly made in occasional instances in different parts of the northern States, but never in such a quantity as to find a place in the returns of the census. Within the last two or three years some attention has been given to the cultivation of the sugar-beet in Ohio and in Illinois. And there seems to be no doubt that sugar can be made in this country from the beet with considerable profit at present prices.

In addition to the sugar and molasses, there is another important item of profit—the leaves of the beets and the refuse pulp. Both can be used as food for cattle, and it must be borne in mind that as nothing is removed but sugar, all the manurial elements of the crop are left for the farm. The cultivation of the beet-root, therefore, is one of the very best methods of increasing the fertility of the farm. On this point M. de Lavergne remarks:

“It was feared, in the first instance, that the cultivation of the sugar-beet would lessen the production of cattle and wheat by occupying the best land. But this fear was ill-founded, at least relative to the best cultivated regions. It is now demonstrated that the manufacture of sugar, by creating a new source of profit, contributes to increase the other products of the soil. The extraction of the saccharine matter deprives the root of only part of its elements. Its pulp and foliage supply the animals

with an abundance of food; and the returns of the sugar-works enable them to add commercial manures, which indefinitely increase the fertility of the soil. In 1855 the city of Valenciennes, the principal seat of the manufacture, was able to inscribe upon a triumphal arch these significant words: 'Produce of wheat in the arrondissement before the manufacture of sugar, 353,000 hectolitres, (961,173 bushels;) number of oxen, 700. Produce of wheat since the manufacture of sugar, 431,000 hectolitres, (1,158 256 bushels;) number of cattle, 11,500.'

The pulp or solid residue amounts to about twenty per cent. of the entire root. When divested of the juice it still contains two or three per cent. of saccharine matter, and is greedily eaten by cattle and pigs, which fatten rapidly upon it. It is said not to be good, however, for milch cows. Ordinary beets and mangel-wurzel contain sugar, but the Silesian beets alone are cultivated for this purpose. By judicious selection and culture, varieties have been obtained which contain much more sugar than the ordinary variety. In obtaining this result, however, the size of the root has been reduced. M. Knauer, of Germany, has produced a variety which he names the imperial beet-root, which contains seventeen and a quarter per cent. of sugar. This improvement places the beet on a par with the cane as a sugar-plant, while the cultivator of the beet has several important advantages over the West India and Louisiana planters. The cultivation of the sugar-cane occupies from twelve to fifteen months, and it must all be manufactured in a few days, or great loss ensues. On the other hand, the beet requires but about four months to arrive at maturity, and then it can be stored and manipulated at leisure. We would earnestly recommend this subject to men of capital, and that the business may not be recklessly undertaken we have obtained from Professor H. Dussauce, an enlightened French chemist, at present residing in this country, an account of the beet cultivated for sugar, and the process of manufacture in France, which we subjoin.

#### OF THE BEET-ROOT.

The presence of sugar in the beet was observed by Margruff, and Achard, of Berlin, attempted the extraction of this sugar on a large scale; but it was only during the period of the continental system that the manufacture of sugar from the beet acquired such perfection in France as made it profitable. The beet so generally cultivated at the present time is derived from the *beta vulgaris*. The two principal varieties of this root are the red beet, which has been grown for a very long time in kitchen gardens, and the white beet. Between these two there are numerous varieties, having a flesh color of various intensity. The seeds of the same plant, in fact, frequently produce varieties of decidedly different shades of color. The red and the white beet, however, appear to be the most constant, and the intermediate varieties are the result of crosses.

The first has a large root, which grows in great part above the ground. It is a very hardy plant, and has been cultivated for a very long time in various parts of the continent as food for cattle, and is now very common. The root which has been preferred for the manufacture of sugar is conical, of a rose color without, and its concentric internal layers are also colored; but it appears that the *white beet of Silesia* is the more productive. The beet thrives in almost all kinds of soils, provided they be sufficiently manured. In Alsace (east of France) it succeeds in light and in strong argillaceous soils indifferently. Another valuable quality which this root possesses is that of succeeding in the most dissimilar climates. It is grown to advantage both in the north and south of France.

The beet is sown at once in the field, or in beds, and transplanted. The latter method appears now to obtain a decided preference, inasmuch as it leaves plenty of time for the preparation of the soil.

In a piece of ground well broken up by delving or ploughing, and highly manured, the seed is sown in lines or drills as soon as the spring frosts are no longer to be apprehended. The transplanting in the east of France takes place about the middle of May, and even in the beginning of June. The plants are generally set about 15 inches apart. In the north the beet harvest does not begin before the end of September, and generally ends in the course of October. The gathering is delayed as long as possible, inasmuch as the root increases visibly to the very end of the season. But gathering the beet

at a very late period in those countries where winter grain has to follow this crop is attended with more than one disadvantage. Without speaking of the difficulties that are incidental to wet seasons, a late seed time is generally unfavorable for wheat. To meet this difficulty Boussingault advises to take up the beets at the period when it becomes necessary to prepare the land for winter seed; that is to say, more than a month before the present general harvest of the root. In doing so he relied upon the interesting fact ascertained by Peligot in the course of his chemical researches, viz: *that the composition of the beet is identical at every age*. In this premature or anticipated beet harvest a less weight of root is of course gathered than would have been obtained at a later period; but the nutritious power of these roots are the same as they would ever have been. The grand questions to be determined were, whether the root would keep or not, and whether the cattle would eat them from the pile as freely as from the field. All this was ascertained in the course of the winter; the beet kept perfectly, and the cattle eat it as freely as ever. The procedure to be adopted to secure a crop of beets of average weight some considerable time before the usual period is simply to transplant earlier, but more closely, with less space between the drills. If experience decides in favor of this method, a late and unfavorable seed time for winter grain will be completely obviated.

The beet which grows above the ground is best gathered with the hand; such as grow under ground require to be loosened by running a plough along the drill. In Alsace it is the custom to take away the leaves, and to trim the roots upon the ground; the refuse thus obtained constitutes a considerable mass of manure, which it is well to plough in immediately.

*Cost of beet culture for two and a half acres of good land in France.*

Rent, taxes, interest .....	\$23 00
Manure .....	26 00
Two ploughings and two harrowings .....	17 20
Seeding .....	3 60
Weeding and delving .....	7 00
Digging and cartage .....	7 20
	<hr/>
	\$4 00

The production varies between sixty and ninety thousand pounds, and, consequently, the price of one thousand pounds is from 95 cents to \$1 40. The value of the leaves used as food for cattle saves some accessory expenses. The leaves falling during the vegetation and the small roots left in the ground represent about 9,600 pounds of manure. The leaves taken from the root vary from thirty to thirty-six thousand pounds. These products are worth from \$10 to \$12.

In France the product of each 110 pounds weight of beet is estimated at 4.56, or somewhat more than four and a half pounds of white sugar. The amount of loss in the manufacture may be conceived from the actual composition of the beet, which, by the process followed by Peligot to exhaust the dry root by boiling it with alcohol of moderate density, appears to contain from 4 to 5, up to 9, 10, 11, and nearly 12 per cent. of sugar. The analysis of Peligot has been confirmed by the experiments of Bracconat, who found the white beet of Silesia to have a very complex composition, as the following table shows:

Water .....	83.5
Sugar .....	10.5
Cellulose and pectose .....	0.8
Albumen, casein, and other neutral nitrogenized matters .....	1.5
Malic and pectic acids, gummy and fatty matters, aromatic and coloring matters, essential oil, &c., &c. ....	3.7
	<hr/>
	100.0

# INTRODUCTION

On an average, the analysis of Pcligot would lead us to conclude that the beet contained, in 100 parts—

Water.....	87.0
Matters soluble in water, (sugar).....	8.0
Matters unsoluble in water.....	5.0
	<hr/>
	100.0
	<hr/>

From which it appears that no more than about two-fifths of the sugar contained in the beet-root is extracted. As in crushing the cane, so in squeezing the rasped pulp of the beet, a part of the loss is owing to a certain quantity of sugar being left in the express-pulp. In fact, with the presses, whilst from 60 to 70 per cent. of juice is obtained, the root actually contains 95 per cent. The loss here, however, is of less consequence than in the cane, the trash of which is used for fuel, whilst the pulp of the beet serves as food for cattle. The pulp indeed is found to possess very nearly the same amount of nutritive power as the root which produces it.

One of the considerations which is of the highest importance in connexion with the production of sugar from the beet is inherent in the difficulty of preserving the root after it is full grown. Gathered at the end of autumn, the root suffers no less from severe frost than it does from mild, open weather; frost destroys its organization, and in mild winters vegetation continues, at the expense of the sugary principle which had been formed during the growth. If the beet actually contains at every period of its existence the same quantity of sugar, there would, probably, be a great advantage in not waiting for the period of complete maturity, by sowing somewhat thicker than wont, any difference of weight would probably be made up, and then there would be no risk of loss in keeping.

The quantity of beet gathered from a given extent of land necessarily varies with the soil, the pains bestowed upon the crop, and the quantity of manure that has been used. The following are a few particulars from official documents:

## *Produce per acre.*

	Tons.	Cwt.	Qrs.	Lbs.
Departement of the pas de Calais.....	12	17	0	4
“ “ “ North.....	14	6	1	23
“ “ “ Cher.....	15	11	0	1

But in other departments the produce is considerably smaller; so that the average for the whole of France has been estimated at not more than ten tons, nine hundred weight, one quarter, and thirteen pounds per acre; an average which approaches very closely to that obtained by Boussingault on his own farm during a period of seven years.

Assuming four and six-tenths pounds of sugar to be obtained from every 110 pounds of beet, the produce, in sugar, from an acre in the course of seven months will amount to nine hundred weight, three quarters, and twenty-two pounds. An acre of land in sugar-cane yields in fourteen months fifteen hundred weight, one quarter, and ten pounds.

To manage one acre of land under beet-root, 45.6 days of a man and 14.1 of a horse was the amount of labor expended. A domain of 360 acres in the south is worked by 150 negroes, which, reckoning the time that the crop is on the ground at fourteen months, would bring the number of days' labor by a man to 177 per acre.

Such an expenditure of labor must, in the nature of things, absorb the greater part of the profits, and it was shown that the cost of cultivation and manufacture of cane-sugar was equal to the value of the produce. Still the cane presents one considerable advantage over the beet—namely, that of furnishing the fuel necessary to the boiling, an advantage which will be better understood when it is known that in the manufacture of every 100 pounds of beet-sugar the consumption of coal amounts to twenty-two pounds.

# INTRODUCTION.

CV

The importance of the fabrication of sugar can be seen in the following table, which indicates the production of this substance throughout the world :

## Annual production.

Bengales, China, Siam.....	200,000,000 pounds.
English colonies.....	440,000,000 "
Spanish ".....	650,000,000 "
Dutch ".....	160,000,000 "
Swedish and Danish.....	20,000,000 "
French colonies.....	220,000,000 "
France*.....	303,000,000 "
Belgium.....	12,000,000 "
Brazil.....	350,000,000 "
United States†.....	420,000,000 "

Russia.....	70,000,000 "
Total‡.....	3,149,000,000

## EXTRACTION OF SUGAR FROM THE BEET.

In so important a fabrication we cannot enter into all the particulars, but give an account of the different processes followed in French manufactures.

The beets are taken out of the ground when they have acquired their full growth, and are carefully separated from those which have been injured by the operation. The beets are made into heaps in the field, and covered with leaves until there is danger of frost, when they must be housed or buried in pits. The upper part of the root at the starting point of the stalk is cut off, because this portion is harder and contains but little sugar.

The beets, after being cleansed and washed, are thrown into a machine, which reduces them to as fine a pulp as possible, and breaks up the cells. The pulp is placed in woollen bags laid on each other, and between which metallic plates are introduced; after which the mass is compressed by a screw-press, and the juice collected which flows out, and which constituted about 0.4 of the juice contained. The bags and plates are then placed under the platform of an hydraulic press, which is unscrewed after having maintained the pressure for about ten minutes, when the bags are placed two by two between two plates, and again still more powerfully compressed. In this manner 75 to 80 per cent. of beet-root juice may be extracted, only about fifteen parts being left in the pulp.

As the juice soon changes, it is essential to raise it as quickly as possible to a high temperature, in order to prevent fermentation, and to saturate with some lime the free acids, which would soon convert a portion of the sugar into glucose. For this purpose the juice on leaving the press is conveyed into a double-bottomed boiler, heated by steam, and the temperature is rapidly raised from 140° to 158°; afterwards it is conveyed into another boiler, also heated by steam, where the *desiccation* or treatment with lime is effected. Hydrated lime is usually made by pouring on quicklime ten times its

\* The fabrication of beet-sugar in France since 1828 to 1836 has raised from 5,330,000 pounds to 90,000,000. From 1837 to 1847 it oscillated between sixty-two and one hundred and six millions. Since that time the production has varied between one hundred and twenty-four and one hundred and fifty-four millions. In 1856 France produced 184,000,000, and in 1858, 303,067,000.

† Louisiana alone produced, in its 1,400 factories, 280,000,000 pounds of raw sugar, and more than 150,000,000 gallons of molasses.

‡ If to this sum we add the quantities consumed in the East Indies and other parts of the world, not enumerated in the above table, we find the quantity to amount to 5,100,404,000 pounds, thus classified :

Cane-sugar.....	2,900,000,000
Beet ".....	960,000,000
Maple ".....	40,494,000
Palm ".....	200,000,000
	5,100,494,000

weight of boiling water, and when the lime is entirely slacked, passing it over a metallic sieve, which arrests the grains of sand and the now decarbonated portions. The juice is first heated to  $167^{\circ}$  in the desiccating boiler, the milk of lime is then added, and the whole is stirred to render the mixture homogeneous; the temperature is raised to  $212^{\circ}$ , the supply of steam being cut off when ebullition commences. The lime combines with the free acids, the albuminous substances, the fatty and coloring matters, producing insoluble compounds, effecting at the same time a kind of clarification by carrying down with the insoluble compounds organic remains which were suspended in the juice. A thick scum having formed on the surface of the liquid, the latter is kept from boiling in order to prevent its rupture by the bubbles of steam. The proportion of lime added varies with the nature of the beet, and with their freshness, only three pounds for one thousand pints of juice being used in the beginning of the season, and with fresh beets, which quantity is gradually increased, and frequently reaches ten pounds before the close of the season. An excess of lime remains in the liquor, and forms a deliquescent compound with a portion of the sugar. In some factories it has been endeavored to saturate it with a proper quantity of acid.

When the operation is terminated, the liquor is drawn off and filtered through animal charcoal; the filters used for this purpose being large sheet-iron cylinders, having a false bottom pierced with holes like a colander. A cloth is extended over the bottom, over which is spread very coarsely powdered animal chalk, added in successive layers until it fills the cylinders to within one and a half foot of the top, when another cloth is laid upon it, and is covered by another metallic plate pierced with holes; each filter receiving from 6,000 to 8,000 pounds of charcoal. The filters should be kept constantly filled with fluid, which is easily done by means of a stop-cock. After this process, by which the juice loses a portion of its coloring matter, and the lime in excess, which adheres to the charcoal, it is conveyed as rapidly as possible into the concentrating boilers, which are generally shallow, and are heated by a circulation of a light pressure of steam through copper tubes arranged over their bottoms. The juice is raised to a temperature of  $70^{\circ}$  in 10 or 12 minutes. The workman judges by indications understood by experience, if it is properly concentrated, or if the boiling is completed. During the ebullition, which terminates at a temperature of  $266^{\circ}$  to  $275^{\circ}$ , a considerable portion of the sugar is altered, and to diminish the loss the evaporation must be effected as rapidly as possible. This operation has been greatly improved by boiling in vacuo—that is, in close boilers, heated by steam, and brought into communication with worms and receivers, in which a vacuum is made. When ebullition takes place at a lower temperature, the quantity of sugar changed is much smaller.

When the sirup is properly boiled, it is collected in a cooler, which generally receives the products of five or six boilings, and its temperature then falls to about  $176^{\circ}$ . Crystallization then commences; but as soon as any crystals form they are detached from the sides and the sirup stirred to bring them again into suspension. When the temperature has fallen to  $130^{\circ}$  or  $122^{\circ}$  the sirup is poured into large conical moulds of metal or baked clay, resting on the point, which is furnished with a hole previously stopped with a plug of wet muslin. The moulds are ranged on long benches with openings, through which the escaping fluids fall into zinc gutters, whence they flow into reservoirs. The temperature of the room containing the moulds should be about  $86^{\circ}$ . Crystallization is completed in about 24 or 36 hours, when the plug is removed from the opening in the mould, and the point of the loaf pierced with an awl so as to draw off the molasses, which is again concentrated even further than the original sirup, and crystallized in moulds. When the molasses is too highly colored, as happens sometimes, it is diluted with a sufficient quantity of water, filtered through animal chalk, concentrated, and recrystallized. The sirup which drains from the second sugar is frequently subjected to the same process for a third time, but the crystallization then requires a great length of time.

When the sugar has drained sufficiently, the loaves are loosened—that is, the moulds are inverted and the loaves detached by gentle blows; after which they are placed in the wareroom, protected from dampness. This is raw beet sugar, which requires refining before being fitted for consumption.

# INTRODUCTION.

cvii

## REFINING.

The process of refining beet-sugar is similar to that of the cane. We give below the different proportions of substances obtained by refining:

*One hundred pounds of raw beet-sugar being refined, give the following.*

Quality of the raw sugar.	Sugar in loaf.	Lump.	Sum of white sugar.	Vergoese.	Molasses.
Line fourth .....	52	15	67	15	18
Fourth common .....	54	16	70	14	16
Fourth ordinary .....	58	17	75	13	13
Good fourth .....	60	18	78	10	12
Clarified .....	70	16	86	5	9

## COST OF THE MANUFACTURE OF BEET-SUGAR.

*Cost of producing six hundred thousand pounds of sugar.*

Ten million pounds of beet-roots cost.....	\$13, 000
Labor.....	4, 200
Fuel.....	3, 600
Lime—animal black.....	2, 400
Ten per cent. on cost of machinery.....	3, 000
Five per cent. on cash capital.....	500
Rents, repairs, and other contingencies.....	4, 950
	<u>31, 650</u>
From which deduct one hundred and twenty thousand pounds of molasses, \$2, 160	
Residue, pulp, &c.....	<u>2, 490</u>
	4, 650
Cost in the factory.....	<u>27, 000</u>
Two hundred pounds in the factory, cost.....	9 00
Handling, storage, &c.....	3 00
Duty.....	9 90
	<u>21 90</u>

Price varies from \$22 to \$28, say \$24; profit, \$2 10.

Showing, on six hundred thousand pounds, a profit of \$6, 300, or \$1 05 per hundred pounds.

Time occupied, one hundred days.

The cost of producing cane-sugar in this country has generally been estimated at about \$3 50 per one hundred pounds.

These statements will enable our readers interested in this subject to realize the practicability of making beet-sugar with profit, especially under the new and unfortunate condition of our country. It is not probable that the prices of an article, the use of which is so general, will very soon fall so low as to render the manufacture of sugar from the beet a precarious or hazardous business.

Since the foregoing was prepared we find an editorial article on beet-sugar in the "Journal of Commerce," of New York, of November 11, 1864, which concludes as follows:

"Beet-sugar is a novelty in this country, but an old story in Europe, where it is manufactured in immense quantities, and daily used on the tables of millions of people. It is sacrosc—possessing all the properties of cane-sugar. The white Silisian beet is considered the best, containing a larger proportion of saccharine matter, and a less amount of injurious salts than any other kind. Fresh beet-roots yield from six to seven per cent. of sugar. The method of manufacture is very simple. The beets are cut or rasped into fine pieces, and the juice is then pressed out, or obtained by infusion. Lime-water is added to make it alkaline; the excess of lime is subsequently removed by a current of carbonic acid gas; the liquid filtered, evaporated and crystallized precisely like cane-sugar. Small experiments in the manufacture of beet-sugar have been made in this country with some success. To make it a reasonably cheap product, however, extensive tracts of land, and large outlays for machinery and labor are required.

"The public will encourage every effort that may be made in this region of discovery and enterprise. The present high prices of sugar afford a good opportunity for talent and capital to develop our latent saccharine resources."

# INTRODUCTION

## HONEY.

Of honey, there was produced in 1860 in the United States 23,366,357 pounds, but little over half the amount of maple sugar.

New York produces 2,369,751 pounds, and North Carolina 2,055,969 pounds. These two States produce more honey than any of the others. Kentucky stands third, producing about 1,750,000 pounds. Missouri and Tennessee rank next, producing over 1,500,000 each. Virginia, Pennsylvania, and Ohio each produce nearly 1,500,000 pounds. Illinois and Indiana each produce about 1,250,000 pounds. No other States than these mentioned, produce one million pounds.

The census of 1850 did not give the amount of honey separately from beeswax. The total amount of honey and beeswax produced in the United States in 1850 was 14,853,790 pounds, and in 1860 24,689,144 pounds, showing an increase of over 60 per cent. The proportion of honey to beeswax is about one pound of beeswax to seventeen and three-quarters pounds of honey.

In our review of the tables of live-stock we have confined ourselves to the official returns, which include for the most part the domestic animals connected with the agriculture of the country. By such a course only can we institute those comparative examinations from which alone can be determined the progress or decline of any interests involved in the census. The amount of live-stock scattered throughout cities and large towns, which escaped the official record, was known to be very considerable in the aggregate; and, to be enabled to arrive at some close approximation thereof, we directed each of the census takers to make return of the numbers of animals in his district believed to have been omitted on his schedules. The summary of these returns will be found in a table at page 192, the details of which may safely be added to the numbers in the official tables immediately preceding to those of the several State tables, and to those given in the present commentary, by such as desire to arrive at the fullest numbers for 1860, while they should be excluded from exhibits from which we would prepare comparative statements. To have embodied the numbers of the table referred to with the official return, or to have included them in this review, would have lessened the means of comparison, and led to erroneous conclusions as to the progress of this branch of agricultural production, having been omitted, as they were, in the previous census.

## HORSES.

There were in the States and Territories 4,336,719 horses in 1850, and 6,249,174 in 1860.

The following table shows the number of horses in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut .....	33,270	26,879
Maine .....	60,637	41,721
New Hampshire .....	41,101	34,233
Massachusetts .....	47,786	42,216
Rhode Island .....	7,121	6,168
Vermont .....	69,071	61,057
Total .....	<u>258,992</u>	<u>212,274</u>

Vermont has more horses than any other New England State. Maine comes next, and then in order succeed Massachusetts, New Hampshire, and Connecticut. There were 212,274 horses in the New England States in 1850, and 258,992 in 1860, showing an increase of nearly 47,000.

## INTRODUCTION.

The following table shows the number of horses in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	503, 725	447, 014
New Jersey .....	79, 707	63, 955
Pennsylvania .....	437, 654	350, 398
Delaware .....	16, 562	13, 852
Maryland .....	93, 406	75, 684
District of Columbia .....	641	824
Total .....	<u>1, 131, 695</u>	<u>951, 727</u>

There are a little over 1,000,000 horses in the middle States. New York has about 500,000 and Pennsylvania only about 60,000 less than New York. Maryland has about 93,500, and New Jersey nearly 80,000.

The following table shows the number of horses in the western States in 1860, as compared with 1850:

	1860.	1850.
Illinois .....	563, 736	267, 653
Indiana .....	520, 677	314, 299
Iowa .....	175, 088	38, 536
Kansas .....	20, 344	.....
Kentucky .....	355, 704	315, 682
Michigan .....	136, 917	58, 506
Minnesota .....	17, 065	860
Missouri .....	361, 874	225, 319
Ohio .....	625, 346	463, 397
Wisconsin .....	116, 180	30, 179
Nebraska .....	4, 440	.....
Total .....	<u>2, 897, 380</u>	<u>1, 714, 431</u>

There were 1,714,431 horses in the western States in 1850, and 2,897,380 in 1860, an increase of over 1,000,000. Ohio has more horses than any other western State, or 625,346. Illinois and Indiana have each over 500,000; Missouri 361,874, and Kentucky 355,704. These five States have over 2,500,000 horses, while all the other western States have less than 500,000.

The following table shows the number of horses in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	127, 063	128, 001
Arkansas .....	140, 198	60, 107
Florida .....	13, 446	10, 848
Georgia .....	130, 771	151, 331
Louisiana .....	78, 703	89, 514
Mississippi .....	117, 571	115, 460
North Carolina .....	150, 661	148, 693
South Carolina .....	81, 125	97, 171
Tennessee .....	290, 882	70, 636
Texas .....	325, 698	76, 760
Virginia .....	287, 579	272, 403
Total .....	<u>1, 743, 697</u>	<u>1, 421, 014</u>

There are less than one and three-fourths million horses in the southern States. Of these over one-sixth are in Texas, and nearly one-sixth in Tennessee. Virginia stands third, having 287,579 horses. There are more horses in Texas, Tennessee, and Virginia, than in all the other southern States together.

# INTRODUCTION.

oxi

The following table shows the number of horses in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California .....	160,610	21,719
Oregon .....	36,772	8,046
New Mexico .....	10,066	5,079
Utah .....	4,565	2,420
Washington .....	4,772	.....
Total .....	<u>216,785</u>	<u>37,273</u>

There are 216,785 horses in the Pacific States. Of this number California has 160,610.

The following table shows the number of inhabitants to each horse in the different sections of the United States in 1860 and in 1850;

	1860.	1850.
New England States .....	12.10	12.85
Middle States .....	7.36	2.96
Western States .....	3.54	2.50
Southern States .....	5.33	5.04
Pacific States .....	2.54	4.79
United States and Territories .....	<u>5.03</u>	<u>5.34</u>

In the United States there were in 1850 one hundred horses to every 534 inhabitants, and in 1860 one hundred horses to every 508 persons.

In the New England States there were only one hundred horses to every 1285 inhabitants in 1850, and one hundred horses to every 1210 inhabitants in 1860. In other words, the increase in the number of horses in the New England States has fully kept pace with the increase in population.

In the middle States there were 696 persons to every one hundred horses in 1850, and 736 in 1860. The increase in the number of horses does not keep pace with the increase in population. It will be seen, however, that there are nearly double the number of horses in proportion to population in the middle States than in the New England States.

In the western States there were in 1850 one hundred horses to every 250 inhabitants, and in 1860 one hundred horses to every 354 inhabitants. In 1850 every family of five persons, on the average, in the western States owned a team; since then the increase in the population has been much greater than the increase in the number of horses. Even now, however, there are two horses to every seven inhabitants.

In the southern States there is about one horse to every five inhabitants.

There are more horses in the Pacific States, in proportion to population, than in any other section. There are now about two horses to every five persons, or about the same proportion as there was in the west in 1850. There are now nearly double the number of horses in the Pacific States in proportion to population than there was in 1850.

## ASSES AND MULES.

The total number of asses and mules in the States and Territories in 1860 was 1,151,148; and in 1850, 559,331, showing an increase of over 100 per cent.

The following table shows the number of asses and mules in the New England States in 1860, as compared with 1850:

	1860.	1850.
Maine .....	104	55
New Hampshire .....	10	19
Vermont .....	43	218
Massachusetts .....	108	34
Rhode Island .....	10	1
Connecticut .....	82	49
Total .....	<u>357</u>	<u>376</u>

There were but 376 asses and mules in the New England States in 1850; and number, there were even still less in 1860, or only 357.

## INTRODUCTION.

In 1850 Vermont had 218, but in 1860 only 43. In Massachusetts, on the other hand, there were 34 in 1850, and 108 in 1860. In Maine, Rhode Island, and Connecticut, there is also an increase. But it is very evident that the mules are not a favorite working animal in the New England States.

The following table shows the number of asses and mules in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	1,553	963
Pennsylvania .....	8,832	2,269
New Jersey .....	6,362	4,089
Delaware .....	2,294	791
Maryland .....	9,829	5,644
District of Columbia .....	122	57
Total .....	<u>28,992</u>	<u>13,803</u>

There were in the middle States 13,803 asses and mules in 1850, and 28,992 in 1860, an increase of over 100 per cent. Maryland, Pennsylvania, and New Jersey employ mules to a considerable extent, but as yet in New York they have not generally been introduced, though they are on the increase.

In Pennsylvania and New Jersey they are used principally in the mining districts; while Maryland adopts, to some extent, the southern system of agriculture, in which mules are more generally used than at the north.

The following table shows the number of asses and mules in the western States in 1860, as compared with 1850:

	1860.	1850.
Indiana .....	28,893	6,599
Illinois .....	38,539	10,573
Ohio .....	7,194	3,423
Michigan .....	330	70
Missouri .....	80,941	41,667
Kentucky .....	117,634	65,609
Wisconsin .....	1,030	156
Iowa .....	5,734	754
Minnesota .....	377	14
Kansas .....	1,496	.....
Nebraska .....	469	.....
Total .....	<u>282,637</u>	<u>129,865</u>

There were in the western States, in 1850, 129,865 asses and mules, and in 1860, 282,637, showing an increase of over 115 per cent. Kentucky has more mules than any other western State, and Missouri comes next. These two States have more than *twice as many* asses and mules as all the other western States. In Illinois and Indiana mules are being extensively introduced, and the same is true of Iowa.

The following table shows the number of asses and mules in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	111,687	59,895
Arkansas .....	57,358	11,559
Florida .....	10,910	5,002
Georgia .....	101,069	57,379
Louisiana .....	91,762	44,849
Mississippi .....	110,723	54,547
North Carolina .....	51,388	25,259
South Carolina .....	56,456	37,483
Tennessee .....	126,335	75,303
Texas .....	63,334	12,463
Virginia .....	41,015	21,483
Total .....	<u>822,047</u>	<u>405,222</u>

# INTRODUCTION.

cxiii

There were in the southern States in 1850 405,222 asses and mules, and 822,047 in 1860. If we add Kentucky, Missouri, and Maryland to the southern States, we then have 1,030,451; while all the other States and Territories have only 120,697 asses and mules.

The following table shows the number of asses and mules in the Pacific States in 1860, as compared with 1850:

	1850.	1860.
California .....	3,681	1,666
Oregon .....	980	420
New Mexico.....	11,291	8,654
Utah.....	851	325
Washington.....	150	.....
Total .....	<u>16,962</u>	<u>11,065</u>

Asses and mules are used to a considerable extent in the Pacific States, but more especially in New Mexico.

In all the States and Territories there were in 1850 one ass or mule to every 41 inhabitants; and in 1860 one to every 27 inhabitants.

In the middle States there was one to every 480 inhabitants in 1850, and one to 298 in 1860.

In the western States there was one to every 48 inhabitants in 1850, and one to 36 in 1860.

In the southern States there was one to every 18 inhabitants in 1850, and one to every 11 inhabitants in 1860.

In the Pacific States there was one to every 16 inhabitants in 1850, and only one to every 32 inhabitants in 1860.

In all the sections except the New England and Pacific States, the increase in asses and mules has been much greater than the increase in population.

It is claimed that a good, well-bred mule will do as much work as a horse, while it can be kept at one-third less expense. Mules are liable to fewer diseases than horses, and will bear ill treatment better. For careless hands they are more profitable than horses, and the high prices which they bring, and the rapidly increasing demand for them, shows that the prejudice against them is not as great as formerly. The active life of a mule is about double that of horses. They require less than half the expense for shoeing. It is claimed that an average lot of mules can be disposed of more readily and at better prices than an average lot of horses; and that, as they cost less to feed, and can be worked a year earlier, they are a more profitable stock to raise.

## WORKING OXEN.

The total number of working oxen in the States and Territories, in 1850, was 1,700,744, and in 1860, 2,254,911; an increase of 32 per cent.

The following table shows the number of working oxen in the New England States in 1860, as compared with 1850:

	1850.	1860.
Connecticut .....	47,939	46,988
Rhode Island.....	7,857	8,189
Massachusetts.....	38,221	46,111
Vermont.....	42,639	48,577
New Hampshire.....	51,512	59,027
Maine.....	79,792	83,593
Total .....	<u>267,960</u>	<u>292,785</u>

Excepting Connecticut, the number of working oxen has decreased in all the New England States since 1850. There were 292,785 in 1850, and only 267,960 in 1860—a decrease of 24,825 in ten years.

## INTRODUCTION.

The following table shows the number of working oxen in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	121,703	178,909
New Jersey .....	10,067	12,070
Pennsylvania.....	60,371	61,627
Delaware .....	9,530	9,797
Maryland .....	34,524	34,135
District of Columbia.....	69	104
Total .....	<u>236,264</u>	<u>296,542</u>

In the middle States also there is a decrease of 60,278 working oxen since 1850. Of this decrease 57,206 is in the State of New York.

The following table shows the number of working oxen in the western States in 1860, as compared with 1850:

	1860.	1850.
Illinois .....	90,380	76,156
Indiana .....	117,687	40,221
Michigan .....	61,686	55,350
Missouri .....	166,688	112,168
Ohio .....	63,078	65,381
Iowa .....	56,964	21,892
Wisconsin .....	93,652	42,801
Minnesota .....	27,568	655
Kansas .....	21,551	.....
Kentucky .....	108,699	62,274
Nebraska .....	12,594	.....
Total .....	<u>820,347</u>	<u>476,898</u>

Here we have a decided increase since 1850—an increase of over 70 per cent. There is an increase of working oxen in every western State except Ohio, where there is a decrease of over 2,303. Ohio, in its agriculture, approximates more closely to the middle than to the western States, and the fact that there is a decrease in the older States shows, what we may well suppose to be the case, that oxen are found more useful in a new country than in one where a higher system of agriculture is adopted.

The following table shows the number of working oxen in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama.....	88,316	66,961
Arkansas .....	78,707	34,231
Florida .....	7,361	5,794
Georgia .....	74,487	73,286
Mississippi.....	105,603	83,485
Louisiana .....	60,358	54,968
North Carolina .....	48,511	37,309
South Carolina .....	22,629	20,507
Tennessee .....	102,158	86,255
Texas.....	172,492	51,285
Virginia.....	97,872	89,513
Total .....	<u>858,494</u>	<u>603,594</u>

There is an increase of working oxen in each one of the southern States. There were in the aggregate 858,494 in the southern States in 1860, against 603,594 in 1850, an increase of over 40 per cent.

# INTRODUCTION.

CXV

The following table shows the number of working oxen in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California .....	26,004	4,780
Oregon .....	7,469	8,114
New Mexico .....	25,266	12,257
Washington Territory .....	2,571	.....
Utah .....	9,168	5,266
Total .....	<u>70,478</u>	<u>30,417</u>

There is a greater increase in the Pacific States than in any other section—an increase of nearly 130 per cent. Oregon shows a slight decrease, while California has increased from 4,780 in 1850, to 26,004 in 1860. There is also a marked increase in New Mexico, though far less than in California.

The following table shows the number of working oxen to each hundred inhabitants in the different sections, and also in the States and Territories:

	1860	1850.
New England States .....	8	10
Middle States .....	2	4
Southern States .....	9	8
Western States .....	8	7
Pacific States .....	12	16
United States and Territories .....	6	7

In the New England States there were ten working oxen to each hundred inhabitants in 1850, and only eight in 1860.

In the middle States there were four in 1850, and only two to each hundred inhabitants in 1860.

In the western States there were seven in 1850, and eight in 1860.

In the southern States there were eight in 1850, and nine in 1860.

In the Pacific States there were sixteen in 1850, and twelve in 1860.

In the States and Territories there were seven working oxen to every hundred inhabitants in 1850, and six in 1860.

The Pacific States have more working oxen in proportion to population than any other section, The southern States come next, then the western and New England States, where the number is the same, and the middle States come last, where there is only one-fourth as many as in New England and the west.

## MILCH COWS AND OTHER CATTLE.

The number of milch cows in the States and Territories, in 1860, was 8,581,735, against 6,385,094 in 1850—an increase of over 33 per cent.

Of "other cattle," not including working oxen, there were in 1860 14,779,373, against 10,293,069 in 1850—an increase of over 43 per cent.

The following table shows the number of milch cows and of "other cattle" in the New England States in 1860, as compared with 1850:

States.	Milch cows.		Other cattle.	
	1860.	1850.	1860.	1850.
Maine .....	147,314	133,556	149,827	125,890
New Hampshire .....	94,880	94,277	118,075	114,606
Vermont .....	174,667	146,128	153,144	154,143
Massachusetts .....	144,493	130,090	97,201	83,284
Rhode Island .....	19,700	18,698	11,548	9,375
Connecticut .....	98,877	85,461	95,091	80,226
Total .....	<u>679,930</u>	<u>608,219</u>	<u>624,888</u>	<u>567,524</u>

## INTRODUCTION.

There were 679,930 milch cows in the New England States in 1860, against 608,219 in 1850; showing an increase of over 70,000. Of "other cattle," not including working oxen, there were 624,886 in 1860, against 567,524 in 1850, showing an increase of over 40,000.

Milch cows have increased about 14,000 in Maine, 14,400 in Massachusetts, 13,400 in Connecticut, and over 28,500 in Vermont.

In "other cattle" there has been a slight falling off in Vermont. It is evident that the dairy is attracting more attention in this State than feeding cattle for beef. In Maine, on the other hand, there is an increase of about 24,000; in New Hampshire, an increase of about 3,500; in Rhode Island, an increase of about 2,200; in Massachusetts, an increase of about 14,000; and in Connecticut, an increase of nearly 15,000.

The following table shows the number of milch cows and "other cattle" in the middle States in 1860, as compared with 1850:

States.	Milch cows.		Other cattle.	
	1860.	1850.	1860.	1850.
New York.....	1,123,634	931,324	727,837	767,406
New Jersey.....	138,818	118,736	89,909	80,445
Pennsylvania.....	673,547	530,224	685,575	564,195
Delaware.....	22,595	19,248	25,566	24,166
Maryland.....	90,463	86,856	119,254	98,595
District of Columbia.....	639	813	198	123
Total.....	2,058,696	1,687,201	1,648,369	1,532,930

The total number of milch cows in the middle States in 1860 was 2,058,696, against 1,687,201 in 1850; an increase of over 370,000. More than half the milch cows of the middle States are in the State of New York. This was also the case in 1850.

Pennsylvania has but little over half as many milch cows as New York, but the rate of increase is as great since 1850 as in the latter State.

Of "other cattle" there were 1,648,369 in the middle States in 1860, against 1,532,930 in 1850, showing an increase of over 115,000. In New York there has been a decrease in this class of stock of about 40,000, while in Pennsylvania there is an increase of over 123,000.

The following table shows the number of milch cows and "other cattle" in the western States in 1860, as compared with 1850:

States.	Milch cows.		Other cattle.	
	1860.	1850.	1860.	1850.
Illinois.....	522,634	294,671	970,799	541,209
Indiana.....	363,553	284,554	588,144	389,891
Iowa.....	189,802	45,704	293,322	60,025
Kansas.....	28,550	.....	43,854	.....
Kentucky.....	209,215	247,475	457,845	442,763
Missouri.....	345,243	230,169	657,153	449,173
Michigan.....	179,543	99,676	238,615	119,471
Minnesota.....	40,344	607	51,345	740
Wisconsin.....	203,001	64,339	225,207	76,293
Nebraska.....	6,905	.....	17,608	.....
Ohio.....	676,585	544,499	895,077	749,067
Total.....	2,825,465	1,511,094	4,438,469	2,837,632

There were 2,825,465 milch cows in the western States in 1860, against 1,811,694 in 1850; showing an increase of more than 1,000,000, or over 55 per cent. Minnesota has increased from 607 in 1850 to over 40,000 in 1860; Iowa, from less than 46,000 to nearly 190,000 in the same period.

Of "other cattle," there were 4,438,469 in the western States in 1860, against 2,837,632 in 1850—an increase of more than 1,600,000, or over 56 per cent. Iowa has increased from 69,000 to over 293,000, and Minnesota from only 740 to 51,000. Wisconsin from 76,000 to 225,000. Kansas, which was unreported in 1850, gives over 43,000 in 1860.

The following table shows the number of milch cows and "other cattle" in the southern States in 1860, as compared with 1850:

States.	Milch cows.		Other cattle.	
	1860.	1850.	1860.	1850.
Alabama.....	230,537	227,701	454,543	433,203
Arkansas.....	171,003	93,151	318,080	105,320
Georgia.....	209,688	334,233	631,707	680,019
Florida.....	92,974	72,876	287,725	182,415
Louisiana.....	129,662	105,576	236,787	414,798
Mississippi.....	207,646	214,232	416,630	436,254
North Carolina.....	228,623	221,700	416,676	434,402
South Carolina.....	163,938	195,244	320,200	563,935
Tennessee.....	249,514	250,456	413,060	414,051
Texas.....	601,540	217,811	2,761,736	661,018
Virginia.....	330,713	317,619	615,882	669,137
Total.....	2,705,838	2,248,788	6,963,074	5,064,612

There were 2,705,838 milch cows in the southern States in 1860, against 2,248,788 in 1850—an increase of over 457,000, or about 20 per cent. There has been a slight decrease in the number of milch cows in Georgia, Mississippi, South Carolina, and Tennessee. While Texas has increased from less than 218,000 in 1850 to over 600,000 in 1860; Arkansas has also increased from 93,000 to 171,000. There has been a slight increase in all the other southern States.

Of "other cattle," there were in the southern States 6,963,074 in 1860, against 5,064,612 in 1850; being an increase of nearly 2,000,000, or nearly 40 per cent, being double the percentage increase in milch cows.

The most remarkable increase is in Texas. There were 2,761,736 in 1860, against 661,018 in 1850, or an increase of over 2,000,000. With the exception of Texas, and Florida, and Alabama, and Arkansas, there has been a decrease of this class of cattle in all the southern States. Next to Texas, Georgia has more cattle than any other southern State; Virginia coming next.

The following table shows the number of milch cows and "other cattle" in the Pacific States in 1860, as compared with 1850:

States.	Milch cows.		Other cattle.	
	1860.	1850.	1860.	1850.
California.....	205,407	4,280	918,731	253,599
Oregon.....	53,170	9,427	93,492	24,188
New Mexico.....	34,369	10,635	29,094	10,085
Utah.....	11,967	4,861	12,169	2,489
Washington Territory.....	9,660	.....	16,228	.....
Total.....	314,573	29,203	1,100,504	290,361

## INTRODUCTION.

There were 314,573 milch cows in the Pacific States in 1860, against 29,203 in 1850, being an increase of over 97.5 per cent. The main increase is in California.

Of "other cattle" there were 1,100,504 in 1860, against 290,361 in 1850, or an increase of nearly 300 per cent.

The following table shows the number of milch cows and "other cattle" to every 100 persons in the different sections, and in the whole United States and Territories:

	Milch cows.		Other cattle.*	
	1860.	1850.	1860.	1850.
New England States .....	21	22	19	20
Middle States .....	24	25	19	23
Western States .....	27	28	45	43
Southern States .....	29	30	75	69
Pacific States .....	56	16	199	106
United States and Territories .....	27	27	47	44

It is somewhat remarkable that the number of milch cows, in proportion to population, should be precisely the same in 1860 as in 1850 in all the States and Territories. By reference to the table (page lxxxv,) showing the amount of butter and cheese produced, in proportion to population, it will be seen that there were 17.62 pounds of butter and cheese to each inhabitant in 1850, and 17.97 pounds in 1860.

In the New England States there were 21 cows to each 100 persons in 1860, against 22 in 1850.

In the middle States there were 24 milch cows to each 100 persons in 1860, against 25 in 1850.

In the western States there were 27 milch cows to each 100 persons in 1860, and 28 in 1850.

In the southern States there were 29 milch cows to every 100 persons in 1860, against 30 in 1850.

In the Pacific States there were 56 milch cows to each 100 persons in 1860, against 16 in 1850.

From the smallest number of cows in 1850, in proportion to population, the Pacific States have risen to the highest in 1860. There are now more than two cows to every family of five persons, and yet, as will be seen by the table showing the amount of butter in proportion to population, there is less than eight and three-quarter pounds of butter, and a little over three pounds of cheese produced to each person.

Of "other cattle" there were in the New England States 20 head to each 100 persons in 1850, and 19 head in 1860.

In the middle States there were 23 head in 1850, and 19 head in 1860.

In the western States there were 43 head in 1850, and 45 head in 1860.

In the southern States there were 69 head in 1850, and 75 head in 1860.

In the Pacific States there were 106 head in 1850, and 199 in 1860.

In the whole United States and Territories there were 44 head to every 100 persons in 1850, and 47 head in 1860.

It will be observed that there are far more cattle, in proportion to population, in the Pacific States, than in any other section. The southern States come next. The western States stand third; the number in which, however, is far less, in proportion to population, than in the southern States.

In the middle and New England States in 1860, the numbers are precisely the same—19 head in both cases.

There are more than twice as many cattle, in proportion to population, in the western States than in the middle and New England States; and in the southern States nearly four times as many.

In the New England and middle States the number of cattle, in proportion to population, has decreased since 1850, and, what is somewhat remarkable, more in the middle States than in the New England States.

\* Meaning cattle not enumerated as "milch cows" or "working oxen."

Taking the western, New England, and middle States together, the increase in the number of cattle has not kept pace with the increase in the population; but it is more than probable that from the introduction of improved breeds, which mature earlier and fatten more readily, there has been no falling off in the supply of beef, in proportion to population, since 1850.

The following table shows the amount of butter and cheese obtained from each cow in the different sections in 1860, as compared with 1850, and in the whole United States and Territories:

	Butter.		Cheese.		Total butter and cheese.	
	1860.	1850.	1860.	1850.	1860.	1850.
New England States .....	75	72	32	44	107	116
Middle States .....	87	80	25	31	112	111
Western States .....	58	49	10	13	68	62
Southern States .....	22	19	$7\frac{1}{2}$	$7\frac{1}{2}$	22	19
Pacific States .....	15	10	5	$2\frac{1}{2}$	20	$12\frac{1}{2}$
United States and Territories.	53	49	12	16	65	65

Taking the whole United States and Territories together, there were 53 pounds of butter obtained from each cow in 1860, against 49 pounds in 1850; and of cheese, 12 pounds in 1860, and 16 pounds in 1850. Of butter and cheese together, there were 65 pounds from each cow in 1860, and precisely the same amount in 1850.

When we consider that a good cow, properly fed, will produce 500 pounds of butter and cheese in a year, these figures do not appear favorable.

In the New England States 75 pounds of butter was obtained from each cow in 1860, and 72 in 1850; and of cheese, 32 pounds in 1860, against 44 pounds in 1850; showing an increase of three pounds of butter to each cow, and a decrease of twelve pounds of cheese. The total product of butter and cheese being 116 pounds in 1850, and only 107 pounds in 1860—a falling off of nine pounds per cow.

In the middle States there were 87 pounds of butter obtained from each cow in 1860, against 80 pounds in 1850.

Of cheese there were 25 pounds in 1860, and 31 in 1850.

In the middle States, as in the New England States, there is a falling off in the production of cheese per cow, but not quite as great as the increase in butter. The total amount of butter and cheese being 112 pounds in 1860, against 111 in 1850; being an increase of one pound per cow.

In the western States there were 58 pounds of butter obtained from each cow in 1860, against 49 in 1850; showing an increase of nine pounds per cow.

Of cheese there were 13 pounds per cow in 1850, and only 10 pounds in 1860; a decrease of three pounds per cow.

The total product of butter and cheese was 68 pounds per cow in 1860, against 62 pounds in 1850; an increase of six pounds per cow.

In the southern States there were 22 pounds of butter obtained from each cow in 1860, against 19 pounds in 1850.

Of cheese there were 6 ounces per cow in 1850, and only 5 ounces per cow in 1860.

In the Pacific States there were 15 pounds of butter obtained from each cow in 1860, against 10 pounds in 1850, and 5 pounds of cheese in 1860, against  $2\frac{1}{2}$  in 1850. The total product per cow, of butter and cheese, being 20 pounds in 1860, against  $12\frac{1}{2}$  in 1850.

#### THE CATTLE DISEASE.—*Pleuro Pneumonia.*

This disease, so fatal in Europe, appeared in this country in 1859. It was brought to Massachusetts by three cows imported from Holland. The disease soon spread, and many valuable herds

## INTRODUCTION.

were decimated. Great alarm was felt, not only in the New England and middle States, but throughout the west. A special session of the legislature of Massachusetts was called, and \$100,000 appropriated for the employment of measures calculated to arrest the spread of the disease. The most important of which was, in brief, as follows: Cattle which are infected, or have been exposed to infection, shall be enclosed in a suitable place and kept isolated; the expense of their maintenance to be defrayed, one-fifth by the town and four-fifths by the State. The cattle may be killed at the discretion of the constituted authorities, and their value paid to the owners. The same authorities may also prohibit the departure of cattle from any enclosure, and also exclude cattle therefrom. They can also prohibit the passage of cattle through the town or city, or of bringing them into it. All cattle that are diseased or have been exposed to the infection, to be marked on the rump with the letter P; and no animal so branded shall be sold or disposed of without the consent of the authorities. All who know, or have reason to suspect, of the existence of the disease among their cattle must give notice of the fact to the authorities.

In addition to the local authorities, three persons are appointed as commissioners, to examine into the nature of the disease, to attend the hospitals or quarantine stations, and to make a report of them to the governor and council. These measures were eminently successful; the disease was speedily arrested, and, from all we can learn from the official accounts, not more than 500 animals died from the disease. In addition to this, 657 animals that had been exposed to contagion were killed, but on post-mortem examination found to be sound; 185 animals were killed that proved to be diseased. One fact seems to be clearly established, that the disease is contagious, and the only sure preventive is to isolate the affected cattle.

The disease is not entirely new in this country. It broke out in the herd of E. P. Prentice, esq., of Mount Hope, near Albany, New York, in 1854. Sixteen animals were affected, fourteen of which died. The disease does not seem at that time to have spread in the neighborhood, and this case attracted no general attention until it broke out in Massachusetts in 1859.

## SHEEP.

The total number of sheep in the United States in 1860 was 22,471,275, against 21,723,220 in 1850; showing an increase of only 748,055.

The following table shows the number of sheep in the New England States in 1860, as compared with 1850:

	1850.	1860.
Connecticut .....	117, 107	174, 181
Maine .....	452, 472	451, 577
Massachusetts .....	114, 829	188, 651
New Hampshire .....	310, 534	384, 766
Rhode Island .....	32, 624	44, 296
Vermont .....	752, 201	1, 004, 122
Total .....	<u>1, 779, 167</u>	<u>2, 247, 583</u>

The total number of sheep in the New England States was 2,247,583 in 1850, and 1,779,767 in 1860, showing a decrease of 467,816. In 1850 Vermont had 1,004,122 sheep, and in 1860 752,201, being a decrease of 251,921. Maine had 456,577 in 1850, and 452,472 in 1860, showing an increase of nearly one thousand. Maine is the only New England State in which there has been any increase since 1850. It may be interesting to mention that Vermont had 1,681,819 sheep in 1840, so that since that date the number of sheep in this State has fallen off more than one-half. In Maine also, though there has been a slight increase since 1850, there is a marked decrease since 1840, at which time there were 649,264 sheep, against 452,472 in 1860. In New Hampshire there has been an equally great falling off since 1840. In Connecticut the decrease is still greater. In the aggregate the number of

# INTRODUCTION.

cxxi

sheep in the New England States has fallen off from 3,442,081 in 1840, to 2,247,583 in 1850, and to 1,779,767 in 1860. In other words, the number of sheep in the New England States has fallen off nearly one-half since 1840.

The following table shows the number of sheep in the middle States in 1860, as compared with 1850:

	1860.	1850.
Delaware .....	18, 857	27, 503
Maryland .....	155, 765	177, 902
New York .....	2, 617, 855	3, 453, 241
New Jersey .....	135, 238	160, 488
Pennsylvania .....	1, 631, 540	1, 822, 357
District of Columbia .....	40	150
Total .....	<u>4, 559, 285</u>	<u>5, 641, 641</u>

The total number of sheep in the middle States in 1850 was 5,641,641, and 4,559,285 in 1860, showing a decrease of 1,082,356.

In 1840 there were 7,402,851 sheep in the middle States, showing a decrease from that time to 1860 of nearly three million. In New York in 1840 there were 5,118,777 sheep, in 1850 3,453,241, and 2,617,855 in 1860.

The following table shows the number of sheep in the western States in 1860, as compared with 1850:

	1860	1850.
Illinois .....	769, 135	894, 043
Indiana .....	991, 175	1, 122, 493
Iowa .....	250, 041	149, 960
Kansas .....	17, 569	.....
Kentucky .....	938, 990	1, 102, 091
Michigan .....	1, 271, 743	746, 435
Minnesota .....	13, 044	80
Missouri .....	937, 445	762, 511
Ohio .....	3, 546, 767	3, 942, 929
Wisconsin .....	332, 954	124, 896
Nebraska .....	2, 355	.....
Total .....	<u>9, 071, 218</u>	<u>8, 845, 438</u>

In 1850 there were 8,845,438 sheep in the western States, and 9,071,218 in 1860, showing an increase of about 225,000. In 1840 there were in the western States 4,574,747 sheep, showing that while the increase has been slight since 1850, it has been very large since 1840, precisely the reverse of that which has taken place in the New England and middle States. In Illinois, Indiana, Kentucky, and Ohio, there has been a decrease in the number of sheep since 1850. The increase has been confined to the newer States.

The following table shows the number of sheep in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	370, 156	371, 880
Arkansas .....	202, 753	91, 256
Florida .....	30, 158	23, 311
Georgia .....	512, 618	560, 435
Mississippi .....	352, 632	304, 929
North Carolina .....	546, 749	595, 249
South Carolina .....	233, 509	285, 551
Tennessee .....	773, 317	811, 591
Texas .....	753, 363	100, 530
Louisiana .....	181, 253	110, 333
Virginia .....	1, 043, 269	1, 310, 004
Total .....	<u>4, 999, 777</u>	<u>4, 565, 069</u>

# INTRODUCTION.

In 1850 there were 4,565,069 sheep in the southern States, and in 1860 4,999,777, showing an increase of 434,708. In 1840 there were in the southern States 3,512,767 sheep, showing an increase since that time of nearly 1,500,000.

In Georgia, North Carolina, South Carolina, Tennessee, and Virginia, there was a decrease in the number of sheep between 1850 and 1860. As a general rule it may be said that the number of sheep has declined in all the older States since 1850.

The following table shows the number of sheep in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California.....	1,088,002	17,574
Oregon.....	86,052	15,382
New Mexico.....	830,116	377,271
Utah.....	37,332	3,262
Washington.....	10,157	.....
Total.....	<u>2,051,659</u>	<u>413,489</u>

In 1850 the total number of sheep in the Pacific States was 413,489, and in 1860 2,051,659; showing an increase of 1,638,170. California alone has increased 1,000,000.

Taking the New England, middle, and western States together, the total number of sheep in 1850 was 16,734,662, and in 1860 15,410,270, showing a decrease in the aggregate number of sheep in these States of 1,324,392. The increase has been in the Pacific and southern States.

The following table shows the number of sheep to each 100 inhabitants in the different sections, and in the whole United States and Territories in 1860, as compared with 1850:

	1860.	1850.
New England States.....	56	82
Middle States.....	53	58
Western States.....	88	140
Southern States.....	54	62
Pacific States.....	371	231
United States and Territories.....	71	93

In 1850 there were 93 sheep to every 100 persons in the States and Territories, and 71 in 1860.

In the middle States there were 58 sheep to each 100 persons in 1850, and 53 in 1860.

In the New England States there were in 1850 82 sheep to each 100 persons, and 56 in 1860.

In the western States there were to each 100 inhabitants 140 sheep in 1850, and 88 sheep in 1860.

In the southern States there were to each 100 inhabitants 62 sheep in 1850, and 54 sheep in 1860.

In the Pacific States there were 231 sheep to each 100 persons in 1850, and 371 sheep in 1860.

## AMOUNT OF WOOL PER SHEEP.

The following table will show the amount of wool from each sheep in the different sections, and in the whole United States and Territories, in 1850 and in 1860:

	1860.	1850.
New England States.....	3.62 lbs.	3.15 lbs.
Middle States.....	3.28 "	2.74 "
Western States.....	2.82 "	2.43 "
Southern States.....	1.95 "	1.82 "
Pacific States.....	1.68 "	0.18 "
United States and Territories.....	2.68 "	2.41 "

In 1850 the amount of wool in the United States and Territories was 2.41 pounds per sheep, and in 1860 2.68 pounds, showing an increase of 0.27 pounds per sheep, or a little over one-quarter of a pound per sheep.

In the New England States the amount per sheep in 1850 was 3.15 pounds, and in 1860 3.62, an increase of 0.57 pound, or over half a pound per sheep.

In the middle States the amount of wool per sheep in 1850 was 2.74 pounds, and in 1860 3.28, an increase of 0.74 pound, or nearly three-quarters of a pound per sheep.

In the western States the amount of wool per sheep in 1850 was 2.43 pounds, and in 1860 2.82 pounds, an increase of 0.39 pound, or about six ounces per sheep.

In the southern States the amount of wool per sheep in 1850 was 1.82 pound, and in 1860 1.95 pound, an increase of 0.13 pound, or about two ounces per sheep.

In the Pacific States the amount of wool per sheep in 1850 was only 0.18 pound, or less than *three* ounces. In 1860 the amount had increased to 1.68 pound, showing that vast improvements have taken place in sheep husbandry in the Pacific States. This has been brought about principally by the introduction of sheep from the Atlantic States and from Australia.

It will be observed that more wool is obtained per sheep in the New England States than in any other section; the middle States coming next, then the western, then the southern, and lastly the Pacific. The increase of wool per head has been greatest in the Pacific States, or over one pound and a half per head. The middle States show the next greatest increase, or about three-quarters of a pound per sheep. The western States come next, or about six ounces per sheep. The southern States show the smallest increase, or only two ounces per sheep.

It may be well to observe that the improvement which has taken place in the New England and middle States in the weight of wool has been obtained, it is believed, to a certain extent, at the expense of quality. It is claimed by the manufacturers that there is more oil or grease in the fleeces than formerly; and it is a fact that they pay more for Ohio and other western wool than for that of the middle and New England States. Vermont wool is usually quoted at five cents per pound less than Ohio wool.

## SWINE.

There were in the States and Territories 30,354,213 swine in 1850, 33,512,867 in 1860, showing an increase of over 3,000,000.

The following table shows the number of swine in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut .....	75,120	76,472
Massachusetts .....	73,948	81,119
Maine .....	54,783	54,598
New Hampshire .....	51,935	63,487
Rhode Island .....	17,478	19,509
Vermont .....	52,912	66,296
Total .....	<u>326,176</u>	<u>361,481</u>

There were in the New England States in 1850 361,481 swine, and in 1860 326,176, showing a decrease of 35,310 head.

There has been a decrease in all the New England States except Maine, where there is an increase of about two hundred.

The following table shows the number of swine in the middle States in 1860, as compared with 1850:

	1860.	1850.
New York .....	910,178	1,018,252
New Jersey .....	236,089	250,370
Pennsylvania .....	1,031,266	1,040,366
Delaware .....	47,848	56,261
Maryland .....	387,756	352,911
District of Columbia .....	1,099	1,635
Total .....	<u>2,614,236</u>	<u>2,719,795</u>

# INTRODUCTION.

There were 2,719,795 swine in the middle States in 1850, and 2,614,236 in 1860; a decrease of over 105,000 head. There is a slight increase in Maryland; all the other States have decreased. In New York alone there is a decrease of over 100,000 head. Pennsylvania has more swine than any other middle State.

The following table shows the number of swine in the western States in 1860, as compared with 1850:

	1860.	1850.
Illinois .....	2,602,308	1,915,907
Indiana .....	3,099,110	2,263,776
Iowa .....	934,820	323,247
Kansas .....	138,224	.....
Kentucky .....	2,330,695	2,891,163
Missouri .....	2,345,425	1,702,625
Michigan .....	372,386	205,847
Minnesota .....	101,371	734
Ohio .....	2,251,653	1,964,770
Wisconsin .....	334,055	159,276
Nebraska .....	25,369	.....
Total .....	<u>14,435,316</u>	<u>11,427,345</u>

There were in the western States 11,427,345 swine in 1850, and in 1860 14,435,316, showing an increase of over three million.

There has been an increase in every western State except Kentucky, in which State there has been a falling off in the number of swine of over half a million.

Indiana has more swine than any other State in the west, or, in fact, of the United States, having 3,099,110, against 2,263,776 in 1850.

Illinois stands next, having 2,502,308 head in 1860, against 1,915,907 in 1850; an increase of over half a million.

Missouri stands next, having 2,345,425, against 1,702,625 in 1850; showing an increase of nearly forty per cent.

Kentucky had more swine in 1850 than any other western State, and more than any other in the United States except Tennessee. She has now, however, about 15,000 less than Missouri.

Iowa shows a remarkable increase in the number of swine, having 323,247 in 1850, and 934,820 in 1860; an increase of nearly 200 per cent.\*

Minnesota has increased from 734 in 1850, to 101,371 in 1860; an increase of 100,000.

The following table shows the number of swine in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama .....	1,748,321	1,904,540
Arkansas .....	1,171,630	836,727
Florida .....	271,742	209,453
Georgia .....	2,036,116	2,168,617
Louisiana .....	634,525	597,301
Mississippi .....	1,532,768	1,582,734
North Carolina .....	1,883,214	1,812,813
South Carolina .....	965,779	1,065,503
Tennessee .....	2,347,321	3,104,800
Texas .....	1,371,532	692,022
Virginia .....	1,599,919	1,829,843
Total .....	<u>15,562,867</u>	<u>15,804,353</u>

There were in the southern States in 1850 15,804,353 swine, and in 1860 15,562,867, showing a decrease of nearly 250,000 head.

Tennessee, Georgia, North Carolina, Virginia, Mississippi, and Texas, are the largest hog-producing States in the south. Adding Kentucky and Missouri to the southern States, it will be seen that there are 20,238,887 head of swine, while in all the other States and Territories there are only 13,273,980.

The following table shows the number of swine in the Pacific States in 1860, as compared with 1850 :

	1860.	1850.
California .....	456,396	2,776
Oregon .....	81,615	30,235
New Mexico .....	10,313	7,314
Washington .....	6,383	.....
Utah .....	6,707	914
Total .....	561,414	41,239

There were 561,414 swine in the Pacific States in 1860, against 41,239 in 1850, showing an increase of over twelve hundred per cent.

California has increased from less than three thousand in 1850, to nearly a half million in 1860.

The following table shows the number of swine in the different sections, and in the United States and Territories, to each hundred inhabitants, in 1850 and in 1860 :

	1860.	1850.
New England States.....	10	13
Middle States.....	31	41
Western States.....	149	181
Southern States.....	175	215
Pacific States.....	101	23
States and Territories.....	106	131

In the New England States there were thirteen head of swine to each hundred inhabitants in 1850, and only ten in 1860.

In the middle States there were, in 1850, forty-one to each hundred inhabitants, and thirty-one in 1860.

In the western States there were one hundred and eighty-one to each hundred inhabitants in 1850, and one hundred and forty-nine in 1860.

In the southern States there were two hundred and fifteen to each hundred inhabitants in 1850, and one hundred and seventy-five in 1860.

In the Pacific States there were, in 1850, twenty-three to each hundred inhabitants, and one hundred and one in 1860.

In all the sections, except the Pacific States, the increase in the number of swine has not kept pace with the increase in population.

It will be observed that there are more swine in the southern States, in proportion to population, than in any other section. There are in the south eight and three-quarters pigs to each family of five persons.

The western States have the next largest proportion of swine. There are nearly seven and one-half to each family of five persons.

The Pacific States have the next largest proportion, or a little over five to each family.

In the middle States there are only about three to ten persons, and in the New England States only one to ten persons.

In the western States there are nearly five times as many swine, in proportion to population, as in the middle States, and fifteen times as many as in the New England States.

In the United States there were one hundred and thirty-one swine to each hundred inhabitants in 1850, and one hundred and six in 1860.

This falling off in the number of swine, in proportion to population, may be accounted for by the increased facilities for the transportation of grain, and its consequent relative advance in price. Pigs can be multiplied so rapidly that, as soon as it is more profitable to feed grain to swine than to sell it,

the supply of pork will be quite equal to the demand. In the New England and middle States pork, up to the present winter, (1864-'65,) has rarely commanded a price at which marketable grain can be fed to swine with a profit. Under the best system of feeding, it requires seven bushels of Indian corn to make one hundred pounds of pork; and, as the freight from the west is much less on the hundred pounds of pork than it is on the seven bushels of corn, (say 420 pounds,) and as hitherto the Atlantic cities have been the principal market, it is more profitable for the western farmers to feed their grain to pigs than it is for the farmers of the middle and New England States. In other words, the farmers of these States are subjected to a more severe competition from the west in the production of pork than in the production of grain. During the present winter grain has been so high in the west that there has been less difference in favor of the western farmer in fattening pork, as compared with the eastern farmer, and the result has been a much higher price in the Atlantic States than ever before known. For the first time in many years it has been quite profitable to fatten pigs on marketable grain in the middle and New England States. The fact is an interesting one, as sustaining the views expressed in the former part of this article in regard to the difficulties under which the farmers of the Atlantic States labor in the production of beef, pork, wool, and other articles on which, in proportion to value, the freight is comparatively light, and, as a consequence, the difficulty of making manure and increasing the fertility of the soil.

# VALUE OF LIVE STOCK.

*Value of live stock in the United States in 1860.*

North Carolina.....	31, 130, 805		
Ohio.....	80, 384, 810	Aggregate.....	1, 089, 329, 915

The aggregate value of live stock in the States and Territories in 1850 was \$545,180,516, and in 1860 \$1,089,329,915, showing an increase of \$545,149,399, or over one hundred per cent.

The following table shows the value of live stock in the New England States in 1860, as compared with 1850:

	1860.	1850.
Connecticut .....	\$11,311,079	\$7,467,490
Massachusetts .....	12,737,744	9,647,710
Maine .....	15,437,533	9,705,726
New Hampshire .....	10,924,627	8,871,901
Rhode Island .....	2,042,044	1,632,637
Vermont .....	16,241,989	12,643,228
Total .....	<u>68,695,016</u>	<u>49,869,692</u>

In round numbers the value of live stock in the New England States was \$50,000,000 in 1850, and \$68,000,000 in 1860, or an increase of \$18,000,000, or 36 per cent.

Vermont stands first in the value of live stock, but not first in increase since 1850. Maine, which is second in the value of live stock, is first in the increase since 1850, having increased nearly \$5,000,000, while Vermont has increased less than \$4,000,000. Massachusetts has increased about \$3,000,000, and Connecticut nearly \$4,000,000, and New Hampshire \$2,000,000.

The following table shows the value of live stock in the middle States in 1860, as compared with 1850:

	1860	1850.
New York .....	\$103,856,296	\$73,570,499
New Jersey .....	16,134,693	10,679,291
Pennsylvania .....	69,672,786	41,600,053
Maryland .....	14,667,853	7,097,634
Delaware .....	3,144,706	1,849,281
District of Columbia .....	109,640	71,643
Total .....	<u>207,585,914</u>	<u>135,698,401</u>

The value of live stock in the middle States in 1850 was \$135,698,401, and in 1860 \$207,585,914, an increase of about \$72,000,000, or 52 per cent.

Nearly one-half the value of live stock in the middle States is in New York, being nearly \$104,000,000 in 1860, against \$73,500,000 in 1850, an increase of about 40 per cent.

In Pennsylvania the increase is still greater, or nearly 70 per cent.

In Maryland, however, the value of live stock has increased more rapidly than in any other middle State, or nearly 100 per cent.

The following table shows the value of live stock in the western States in 1860, as compared with 1850:

	1860.	1850.
Illinois .....	\$72,501,225	\$24,209,258
Indiana .....	41,855,539	22,478,555

Total .....	<u>382,405,994</u>	<u>157,046,823</u>

## INTRODUCTION.

In the western States in 1850 the value of live stock was \$157,046,823, and in 1860 \$382,405,994—an increase of \$225,359,171, or 143 per cent.

We have not space to allude to the value of live stock in the different States. The table speaks for itself, and is worthy of careful study. Ohio shows the greatest value of live stock in 1860, and also in 1850. Kentucky stood second in 1850, but is third in 1860. Illinois being about \$11,000 000 in advance of her at the last census.

Kansas, which was unreported in 1850, had to the value of \$3,332,450 in 1860.

The following table shows the value of live stock in the southern States in 1860, as compared with 1850:

	1860.	1850.
Alabama.....	\$43,411,711	\$21,690,112
Arkansas.....	22,096,977	6,647,969
Florida.....	5,553,356	2,880,058
Georgia.....	38,372,734	25,728,416
Louisiana.....	24,546,940	11,152,275
Mississippi.....	41,891,692	19,403,662
North Carolina.....	31,130,805	17,717,647
South Carolina.....	23,934,465	15,060,015
Tennessee.....	50,211,425	29,978,016
Texas.....	42,825,447	10,412,927
Virginia.....	47,803,049	33,656,659
Total .....	<u>381,778,601</u>	<u>194,927,756</u>

The value of live stock in the southern States in 1850 was \$194,327,756, and in 1860 \$381,778,601—an increase of \$187,450,845, or 86 per cent.

The following table shows the value of live stock in the Pacific States in 1860, as compared with 1850:

	1860.	1850.
California.....	\$35,585,017	\$3,351,058
Oregon.....	5,946,255	1,876,189
New Mexico.....	4,999,746	1,494,629
Washington.....	1,099,911	.....
Utah.....	1,516,707	546,968
Total .....	<u>49,147,636</u>	<u>7,268,844</u>

The value of live stock in the Pacific States in 1850 was \$7,268,844, and in 1860 \$49,147,636—an increase of \$41,878,792, or 576 per cent.

It will be observed that the *increase* in the value of live stock since 1850 is:

New England States.....	36 per cent.
Middle States.....	52 “
Western States.....	143 “
Southern States.....	86 “
Pacific States.....	576 “
States and Territories.....	100 “

## RECAPITULATION.

It may be interesting to place together in a table the amount of some of the leading products, in proportion to population, in 1860 and in 1850. Such a table will show at a glance the progress we have made since 1850. We have prepared the following table for this purpose:

Table showing the amount of the principal agricultural products in the different sections, and in the States and Territories, in proportion to population, in 1860 as compared with 1850.

SECTIONS.	AMOUNT OF PRODUCTS TO EACH INHABITANT.																							
	Wheat.		Indian corn.		Barley.		Rye.		Oats.		Buckwheat.		Peas and beans.		Irish potatoes.		Sweet potatoes.		Butter.		Cheese.			
	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.	1860.	1850.		
	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Bush.</i>	<i>Lbs.</i>	<i>Lbs.</i>	<i>Lbs.</i>	<i>Lbs.</i>

States and Territories . . . . .	5.44	4.33	26.12	26.04	6.40	0.22	0.66	0.64	5.40	6.32	0.56	0.38	0.48	0.35	3.57	2.83	1.32	1.06	14.64	13.51	3.26	4.11		

This table is worthy of careful study. It will be seen that in proportion to population, taking the States and Territories together, there has been a slight increase in our principal crops since 1850. Of wheat, Indian corn, barley, rye, oats, buckwheat, and peas and beans, we raised in 1850 38.28 bushels to an inhabitant, and in 1860 39.15 bushels. This shows an increase in the total amount of these crops of nearly *one bushel* to each inhabitant since 1850.

When it is remembered that our horses, cattle, sheep, swine, &c., have also increased, and that these animals have to be fed to a certain extent on the products named, a total increase of *one bushel* to an inhabitant is small indeed. With a country of great extent, abounding with the accumulated fertility of centuries, this exhibit of the products of our agriculture is not flattering.

In the New England States the total amount of the crops named was 8.11 bushels in 1850, and 7.92 bushels in 1860, showing a decrease of .18 of a bushel. In the middle States they amounted to 26.27 bushels in 1850, and 25.33 bushels in 1860, showing a decrease of nearly one bushel. In the western States the crops named amounted in 1850 to 59.62 bushels to each inhabitant, and in 1860 to 62.96, showing an increase of over three bushels to each inhabitant. In the southern States these crops amounted to 38.89 in 1850, and 38.07 in 1860, showing a decrease of nearly one bushel to each inhabitant. In the Pacific States these crops amounted in the aggregate to 5.47 bushels to each inhabitant in 1850, and to 29.01 in 1860, showing an increase of twenty-three and a half bushels to each person.

There is, therefore, a decrease in all the sections except the western and Pacific States; but the increase in these *more* than makes up for the decrease in the New England, middle, and southern States.

We think these figures will show the necessity of an improved system of agriculture. If in a period of profound peace and general prosperity our products but barely kept pace with the increase in population, it is certain that the *same* system of cultivation will not enable us to do so in a period of war. It is probable, however, nay, almost certain, that the high prices which farmers are now obtaining for their products will lead to a better system of agriculture.

#### CATTLE AND CATTLE TRADE OF THE WEST.

It was not long after the first settlement of the interior of Ohio before the earlier pioneers perceived the absolute necessity for a market for the product of the soil. They had cast their lot in the midst of an extensive new country, where the land was eminently fertile; and the question, how could the product of that soil be advantageously disposed of, received their early and earnest consideration. The early great immigration would furnish a market for the time being, but the rapidly increasing production would soon outstrip this consumption, and to attempt to transport the surplus grain in its primitive bulky state was out of the question. The great distance from market would require it to be condensed to its smallest possible compass. The article of wheat might be made into flour, and by the means of flatboats or barges floated out of the tributaries of the Ohio river, thence down that stream and the Mississippi to New Orleans. This was the only practical way open, and that only, to any great

extent, for the one product—flour; and notwithstanding the hazards and hardships to be encountered in that trade at an early day, the extreme scarcity of money, combined with the restless and daring character of the young men of that period, it was entered into with a will, and for a time the enterprise was generally remunerative, and oftentimes highly so. The trials and hardships of a flatboat voyage to New Orleans before the days of steamboats are but little appreciated by the present generation. To float a boat down to New Orleans was easy enough, provided they got safely out of the smaller streams; but the return-trip of nearly one thousand miles by land, the greater part of the way through an uninhabited and almost unbroken forest, was generally made on foot, and if the freshets in the smaller streams did not occur until middle or late spring, these trips were oftentimes attended with great mortality. Nevertheless, the trade flourished, and rapidly increased, until at length, some years after the close of the war of 1812, the supply so far outran the demand that the business became very precarious, oftentimes resulting in a loss to the shipper of almost the entire cargo. The consequence was the price of wheat was reduced so low as no longer to be regarded as the staple product of the western farmer, and indeed it finally ceased for a time to be a cash article; and it was no uncommon sight to see stacks of wheat rotting down in the field—twenty-five cents per bushel in store-goods or trade being the highest price obtainable by the farmer.

The large bodies of rich bottom-land lying on the borders of the tributary streams of the Ohio were not adapted to wheat-culture, and on the Scioto river much of the land was owned by immigrants from the south branch of the Potomac river, Virginia, where the feeding of cattle had been carried on for many years in a manner peculiar to that locality, and which materially differed from the mode practiced in Pennsylvania or further north. The cattle were not housed nor sheltered, but simply fed twice a day in open lots of eight or ten or more acres each, with unhusked corn with the fodder, and followed by hogs to clean up the neglected grains and ears; which practice was adopted here, and is still the almost universal method throughout the west, having undergone but little or no material change in fifty years. It may be worthy of remark here, that the method of securing the corn after maturity by cutting off the stalks near the ground, and stacking it in the field where it was grown in stacks of from twelve to sixteen hills square, also originated with the feeders of cattle of the south branch, the convenience and utility of which mode is made manifest by its general prevalence at the present day.

Although the business of fattening cattle was well understood by many of the earlier pioneers, and to find a market for corn was an anxious thought, yet they hesitated to engage in it. By many it was considered that the great distance from market would render that mode of disposing of their surplus corn impracticable; the long drive to an eastern market would so reduce the cattle in flesh as to render them unfit for beef; but some thought otherwise, and among the latter was George Renick, lately deceased, an enterprising and intelligent merchant, who, owning a considerable landed estate, concluded, himself, to try the experiment. Accordingly in the winter of 1804-'05, he fed a lot of cattle and sent them to Baltimore the following spring—(the first fat cattle that ever crossed the Alleghany mountains;) the result was a complete success. Thus was another avenue of trade practically opened, which for half a century contributed largely to the wealth of the Scioto valley; and from this small beginning the trade increased gradually, but not rapidly, until some years after the close of the war, when the failure of wheat to command cash gave a great impetus to the raising and feeding of cattle and hogs; for, although the selling price of such stock was very low, they were the only remaining cash articles of the farmer, and the cost of production was not very carefully considered. There was no alternative, as he was obliged to have some money wherewith to procure the necessities of life, pay taxes, &c., and the business continued to increase rapidly until about the year 1850, notwithstanding the opening of the New York and Ohio canals in the mean time, had added greatly to the resources of the Ohio farmer by giving him access to a better and more reliable market, enabling him to sell for cash, not only his wheat, but every other product of the soil, at much more remunerating prices than formerly. The completion of the great through railroads added still further to the farmer's resources enabling him to diversify his pursuits, and assisted in bringing the corn-feeding of cattle, so far as Ohio was concerned, to its culminating point. From his personal knowledge of the business, it is the con-

viction of the present Mr. Renick, that since then it has been on the decline. The whole number of cattle corn-fattened in Ohio may not have perceptibly decreased, but the home consumption, including the extensive barrelling, has greatly increased; but the excess or the number sent to an eastern market from that region has evidently, during the last decade, fallen off, and the cattle of late years are not so heavy nor made so fat as formerly. Mr. Renick gives it as his opinion that cattle can no longer be corn-fed in Ohio for the great length of time and in the profuse manner as formerly, with profit; indeed, in some of the largest feeding districts of twenty years ago the business has entirely ceased; and he very much questions whether the business can be profitably carried on as a leading one with the farmer in any locality possessing other ordinary modern resources, when the population of that locality exceeds fifty inhabitants to the square mile, exclusive of populous towns, and can then only be done profitably in a limited way, as a secondary or attendant on other pursuits of the farmer, and then in a different manner from that now generally pursued. The construction of the great through railroads, which tended to diminish the feeding of cattle in Ohio, contributed largely to its wonderful increase in Illinois and other western States, affording them facilities for reaching an eastern market of which they had hitherto been almost deprived—the distance the cattle had to travel *proving actually* too great, as the pioneers at first *supposed* it would, from Ohio; and though the railroads also facilitated the transportation of fat cattle from Ohio, adding but little to the cost, and saving to the drover near or quite one hundred pounds of flesh, on an average, to each animal, yet, by affording quicker and at all times a more certain conveyance for other things as well, particularly the article of whiskey, and the manufacturers of that article being able to pay more for corn than the cattle-feeders could possibly afford to do, they more than counterbalanced the advantages derived therefrom to stock-raising. Hence, in localities favorably situated for the sale of corn, the business of feeding it to cattle has become a comparatively unimportant one.

Before the era of railroads, to break the long drive, large numbers of stock or store-cattle were annually driven from Illinois and the west into Ohio to be fed there, and when made fat were sent to an eastern market; but that trade has now become almost obsolete. Formerly, too, the driving of stock-cattle from Ohio to Pennsylvania and the east was conducted on an extensive scale, and indeed that trade, during the State's gloomiest pecuniary period, ranked as one among her chief resources, always commanding money in hand, however low the price might be; but that trade has also ceased, except to a comparatively limited extent from the northern part of the State into that of New York.

To avoid misapprehension, let us here say, that our remarks thus far with reference to beef-cattle in Ohio apply only to those made fat, or mostly so, on corn, as doubtless the number of *grass-fattened*, or those that have been but slightly fed on corn, has somewhat increased. Indeed, the whole business of fattening cattle has undergone a great change since the era of railroads. Formerly the great bulk of the corn-fed cattle of the west, nine-tenths of which were from Ohio and Kentucky, chiefly from Ohio, sent to the eastern markets, arrived there between the middle of April and 1st of August, and the markets of New York in particular were chiefly supplied from those sources during that time, and grass-fattened cattle were sent in the fall from Ohio in limited numbers, and no cattle arrived in those markets from the west during the winter or first month of spring; but now they are sent at all seasons of the year, and but few of those are so heavily corn-fed or made so fat as formerly. In a word, there is not near so much consumed in fattening cattle in Ohio now as there was twelve or fifteen years ago; yet there are, doubtless, more cattle partially fed now than then, but grass is more relied upon to prepare the cattle for market. Nor is there the same *occasion* to make them so solidly fat as formerly, for the conveyance to market by railroad is a great saving of flesh over the former method of driving.

It is not to be understood that cattle are better or longer grazed than formerly, for the contrary is the fact; but formerly, when the business of feeding cattle on the Scioto river was at its height, say from 1840 to 1850, to make an A No. 1 lot of fat cattle, the best grades were fed some ten to twenty bushels of corn in March and April when they were three years old, and other cattle at the age of four years; they were then grazed throughout the whole summer and fall in the best manner, then fed from four to five and a half months all the corn they would eat—say full half bushel per day each before

starting to market; cattle that had no corn the previous spring were well grazed and fed from five to six months. Now, cattle handled as the former would begin to go to market by the 1st of July, and all or nearly all would be in market before the 1st day of January. Quite a common way of prosecuting the business now is to commence feeding the cattle in January or February, *when less than three years old*, on corn in limited quantities, substituting more fodder or other rough feed, but increasing the quantity of corn in March or April, often to full feeding, say from twenty-five to forty bushels in the aggregate, per head, and these cattle will commence to be sent to market by the 1st of June, and by the 1st of October by far the greater portion will have gone; comparatively few of them, perhaps, having been detained to be fed on corn for a month or two before starting them. Of course the quality of the beef of cattle so young, and handled after this fashion, can bear no comparison with that as made by the former method.

The first introduction into the west of English cattle was made by Matthew Patton, (hence the name given to that celebrated stock,) who removed from Hardy county, Virginia, to Kentucky, about the year 1794, and brought the cattle with him. Patton had obtained the ancestors of this stock of Mr. Goff, of Maryland, in 1783, who had then recently imported them from England. John Patton, a son of Matthew, removed in 1800 from Kentucky to Chillicothe, Ohio, bringing a part of the same stock with him. Between that time and 1817, occasionally a few other animals were introduced, mostly of the same breed, but including some of an importation made by a Mr. Miller, of Maryland, between 1790 and 1795. These cattle, both Goff and Miller importations, were of very large size, and the cows generally good milkers, and when first introduced were a fine quality of beef-cattle—bone not large for the size of the animal—but on account of their great growth were longer maturing than the common stock of the country; but in the course of time their defects grew upon them. They became larger, coarser, and longer maturing, and of course harder to fatten. This change was attributed to the rich feed, which was probably the fact. We know that poor feed will degenerate, and it was probably this latter fact that led Count Buffon, the great European naturalist, to assert that all animals when translated from Europe to America would degenerate. The finest animal of the cow kind I have ever seen was of this breed; in the fall of 1819 this was six and one-half years old, and was estimated to weigh over 2,000 pounds, net beef. His head, neck, and limbs were remarkably neat, his brisket very deep and broad, and he girted immediately behind the shoulders the extraordinary measure of ten feet ten inches, and his back and loin I certainly never have seen excelled, if equalled. I have been thus minute in this description, because I have seen several treatises, or rather communications on the comparative excellence of the different breeds of cattle imported into this country, and all of them disparaging in a greater or less degree this breed of cattle. This breed proved an admirable one for crossing with the *common* stock of the country better, perhaps, than any following importation. In 1817 Messrs. Saunders, Zugarden, and ———, of Kentucky, imported from England five bulls—three short horns, and two long horns—and eight or nine cows of the two breeds. The long horns being the most sightly animals, took the fancy of the people at first, and some of those having good stock of former importations wellnigh ruined them for the shambles by introducing the long horns among them. Their flesh was very dark and tough, without any admixture of fat, as a butcher's animal should have, and withal the cows were poor milkers. The short horns proved a valuable acquisition to the existing stock of the country, though the quality of their beef was perhaps no better than the Patton or Miller stock, nor were the cows better milkers, but their early maturity, and aptitude to fatten were qualities peculiarly desirable at the time, had they been properly appreciated and improved upon by the breeders generally. But unfortunately, in Kentucky in particular, the long horns got a pretty general dissemination before they were entirely discarded, and a practice of somewhat indiscriminate breeding followed, producing about as undesirable a stock for the shambles as could well be imagined. They were very large, but very unsaleable, and nick-named by the butchers of the eastern cities, "red horses." There never was enough of the short horned breed clear of admixture in the eastern markets for their shamble qualities to be clearly established by the butchers there, though in the west it was known to be at least not inferior to any breed then existing.

But it was not until about 1832 to 1836 that a general interest for the improvement of the stock of cattle began to be manifested by the farmers and cattle men at large. Hitherto it had been confined chiefly to a few individuals in different localities in Kentucky, Ohio, and other western States, though more general in the former. But the beautiful display at the county fairs (then recently revived) and elsewhere of the many beautiful animals of the English improved Durhams, imported by the different associations into Kentucky and Ohio about that period, combined with the almost fabulous prices which they would command, contributed in no small degree towards creating the general interest on the subject that followed, and which resulted within a few years thereafter in a great improvement in the quality of the stock throughout the whole west, greater, perhaps, than would have otherwise taken place within a quarter of a century. Nor were the people misled by appearances this time; for, after thirty years' trial, this breed, when well cared for, still maintains its English reputation of possessing, in a greater degree than any other stock, all the essential qualities, such as size, neatness of form, early maturity, aptitude to fatten, and the marbled admixture of fat with the lean in the beef requisite to make both the raising and feeding more profitable, as well as furnishing to the consumer a superior quality of beef. But the present management of these cattle, and their crosses, called "grades," is nowise calculated to sustain the hitherto high character of their beef among consumers. Apparently both feeders and drovers, not willing to be behindhand with the railroads, nor any other fast thing in this fast age, make haste to realize and hurry off their *half-fatted* stock to market at the early age of three years, thereby involving an absolute waste of "raw material;" whereas, if those same cattle were kept one year longer, and made ripe for the shambles, there would not only be a gain of full one-third in weight, but they would produce a quality of beef not excelled in any country or clime.

The wonderful increase of late years both in the production and consumption of beef cattle in the United States, the one obviously keeping pace with the rapid strides of the other, has developed in part the capabilities of the vast western prairies, providentially provided beforehand to meet the wants of a great nation increasing in population and advancing in wealth and power with a rapidity wholly unprecedented in history.

The original or common cattle of the west were introduced into the country from various quarters, the earlier immigrants from Pennsylvania, Virginia, and other States bringing a greater or less number of cows with them, and the Indians furnished a part. Of course they were a heterogeneous collection; yet, in the process of time, in each considerable district of country of similar formation and resources; where there was no effort made at improvement, the stock assimilated or acquired characteristic qualities peculiar to itself, and so dissimilar from other sections as to enable the experienced cattle dealer to readily determine, by the general appearance of the stock, the region of country in which the cattle were raised. In the more hilly and timbered localities the cattle were smaller, of compact build, hardy, healthy, and easily fatted; whereas, in the more open portions of the country, where the feed was abundant, the stock became larger, looser made, coarser, more subject to disease, and harder to fatten; but the general effort made of late years to improve the stock by the introduction of improved breeds has rendered these local characteristics less distinguishable than formerly.

The manner of raising or breeding of cattle has undergone considerable change of late years. Formerly, when the price of land was very low, and the range extensive, it was the general custom of farmers and cattle men to keep more cows than were actually necessary to supply the wants of the family; indeed, many of them kept large herds of cows for the sole purpose of raising cattle. But that business has now, at least so far as Ohio and Kentucky are concerned, almost entirely ceased, though it is still carried on to a limited extent further west and south, more particularly in Texas, where, before the war, many individuals could count their herds by the thousand. Yet, even in Ohio and Kentucky, the number of cows has not decreased, but, on the contrary, doubtless has largely increased, more especially in Ohio, where, in addition to the largely increased home consumption, the extensive cheese manufactories and large export of butter of late years have rendered a largely increased number of cows necessary. The calves of these cows are, to a considerable extent, bought up by dealers in the fall.

But it was not until about 1832 to 1836 that a general interest for the improvement of the stock of cattle began to be manifested by the farmers and cattle men at large. Hitherto it had been confined chiefly to a few individuals in different localities in Kentucky, Ohio, and other western States, though more general in the former. But the beautiful display at the county fairs (then recently revived) and elsewhere of the many beautiful animals of the English improved Durhams, imported by the different associations into Kentucky and Ohio about that period, combined with the almost fabulous prices which they would command, contributed in no small degree towards creating the general interest on the subject that followed, and which resulted within a few years thereafter in a great improvement in the quality of the stock throughout the whole west, greater, perhaps, than would have otherwise taken place within a quarter of a century. Yet, even in Ohio and Kentucky, the number of cows has not decreased, but, on the contrary, doubtless has largely increased, more especially in Ohio, where, in addition to the largely increased home consumption, the extensive cheese manufactories and large export of butter of late years have rendered a largely increased number of cows necessary. The calves of these cows are, to a considerable extent, bought up by dealers in the fall,

starting to market; cattle that had no corn the previous spring were well grazed and fed from five to six months. Now, cattle handled as the former would begin to go to market by the 1st of July, and all or nearly all would be in market before the 1st day of January. Quite a common way of prosecuting the business now is to commence feeding the cattle in January or February, *when less than three years old*, on corn in limited quantities, substituting more fodder or other rough feed, but increasing the quantity of corn in March or April, often to full feeding, say from twenty-five to forty bushels in the aggregate, per head, and these cattle will commence to be sent to market by the 1st of June, and by the 1st of October by far the greater portion will have gone; comparatively few of them, perhaps, having been detained to be fed on corn for a month or two before starting them. Of course the quality of the beef of cattle so young, and handled after this fashion, can bear no comparison with that as made by the former method.

The first introduction into the west of English cattle was made by Matthew Patton, (hence the name given to that celebrated stock,) who removed from Hardy county, Virginia, to Kentucky, about the year 1794, and brought the cattle with him. Patton had obtained the ancestors of this stock of Mr. Goff, of Maryland, in 1788, who had then recently imported them from England. John Patton, a son of Matthew, removed in 1800 from Kentucky to Chillicothe, Ohio, bringing a part of the same stock with him. Between that time and 1817, occasionally a few other animals were introduced, mostly of the same breed, but including some of an importation made by a Mr. Miller, of Maryland, between 1790 and 1795. These cattle, both Goff and Miller importations, were of very large size, and the cows generally good milkers, and when first introduced were a fine quality of beef-cattle—bone not large for the size of the animal—but on account of their great growth were longer maturing than the common stock of the country; but in the course of time their defects grew upon them. They became larger, coarser, and longer maturing, and of course harder to fatten. This change was attributed to the rich feed, which was probably the fact. We know that poor feed will degenerate, and it was probably this latter fact that led Count Buffon, the great European naturalist, to assert that all animals when translated from Europe to America would degenerate. The finest animal of the cow kind I have ever seen was of this breed; in the fall of 1819 this was six and one-half years old, and was estimated to weigh over 2,000 pounds, net beef. His head, neck, and limbs were remarkably neat, his brisket very deep and broad, and he girted immediately behind the shoulders the extraordinary measure of ten feet ten inches, and his back and loin I certainly never have seen excelled, if equalled. I have been thus minute in this description, because I have seen several treatises, or rather communications on the comparative excellence of the different breeds of cattle imported into this country, and all of them disparaging in a greater or less degree this breed of cattle. This breed proved an admirable one for crossing with the *common* stock of the country better, perhaps, than any following importation. In 1817 Messrs. Saunders, Zugarden, and ———, of Kentucky, imported from England five bulls—three short horns, and two long horns—and eight or nine cows of the two breeds. The long horns being the most sightly animals, took the fancy of the people at first, and some of those having good stock of former importations wellnigh ruined them for the shambles by introducing the long horns among them. Their flesh was very dark and tough, without any admixture of fat, as a butcher's animal should have, and withal the cows were poor milkers. The short horns proved a valuable acquisition to the existing stock of the country, though the quality of their beef was perhaps no better than the Patton or Miller stock, nor were the cows better milkers, but their early maturity, and aptitude to fatten were qualities peculiarly desirable at the time, had they been properly appreciated and improved upon by the breeders generally. But unfortunately, in Kentucky in particular, the long horns got a pretty general dissemination before they were entirely discarded, and a practice of somewhat indiscriminate breeding followed, producing about as undesirable a stock for the shambles as could well be imagined. They were very large, but very unsaleable, and nick-named by the butchers of the eastern cities, "red horses." There never was enough of the short horned breed clear of admixture in the eastern markets for their shamble qualities to be clearly established by the butchers there, though in the west it was known to be at least not inferior to any breed then existing.

who, perhaps, keep them a year, and then they pass into other hands, who, in turn, keep them another year, when the stock in large numbers passes into the hands of the feeders. This cannot be said to be the universal custom, but its practice is sufficiently prevalent to be designated as general. A very limited proportion of this stock is housed or sheltered during the winter, at least south of forty-one degrees of north latitude, unless it be the calves the first winter to some extent; nor is it the custom to house any cattle even while preparing for market. They are generally fed in open lots, though positions sheltered from wind and storms by timber or other natural obstructions are taken advantage of.

In communicating his experience with Texas cattle, Mr. Renick writes as follows:

"In the winter of 1853-'54 I had purchased for use about 1,200 head of cattle in the northern part of Texas, which section of country had been to a considerable extent settled by immigrants from Illinois and Missouri, and who had brought their stock with them; and this stock had not yet been sufficiently intermixed with the Spanish or Opelousas cattle further south to materially deteriorate their original qualities; consequently they were a much better and larger stock than I expected to see, though they had in some measure acquired the wild nature of the more southern stock. These cattle were brought to Illinois in the spring and summer of 1854—the first, I believe, that ever came from Texas, at least in large numbers. This enterprise created quite an excitement in the northern part of Texas, and all my correspondents there manifested a strong desire to have this new trade continued and extended, freely offering their best efforts to encourage it, as they believed it would result advantageously to all concerned, and promising, if successful, to send north for a better breed of cattle, as they said, and with truth, that they could raise cattle and deliver them in Illinois, with satisfactory profits to themselves, for less, by one-half, than they could be raised in that State. In anticipation of this trade being continued the following season, quite a large number of cattle were brought up from points further south, and, as was expected, the trade opened lively; but an unforeseen difficulty exploded the whole business within the next two years. It was found that the southern or Spanish cattle were subject to an epidemic or contagious disease somewhat resembling the yellow fever in the human race, and so contagious did it prove that all along the track those cattle were driven the farmers lost large numbers of their cattle from that disease, many losing almost their entire stock within a few days. So serious was the loss occasioned by each drove of Texas cattle passing through, that the inhabitants of southwestern Missouri held conventions in divers places, and resolved that no more Texas cattle should pass through the country, and, by order of these conventions, armed bands or patrols were appointed, whose duty it was to turn back all Texas droves that might attempt to pass, which they did effectually. Thus ended what at one time seemed a promising trade. From the short trial, however, it became evident that, from the inferiority of the Texas stock as beef cattle, the trade would not have resulted as satisfactorily as was anticipated; the cattle were very light weighers for their size of frame, with but little room for improvement, and so wild as to be almost unmanageable. For oxen for the Santa Fe trade, or long drives over flinty roads, their hardness of hoof, their agility and endurance render them unrivalled; and, though they never lose entirely their wild nature, yet, when judiciously trained, they become quite tractable."

#### THE PORK TRADE.

The first general violations of the levitical law prohibiting the use of swine flesh must have occurred in comparatively modern times, inasmuch as that article has only recently become sufficiently well esteemed to be introduced largely into commerce. Since, however, it has been discovered to be one of the most easily produced, and about the most easily preserved of all meats, but few articles of food have come into more general use among civilized nations.

The raising of the hog has proved to be so well adapted to the varied systems or phases of agriculture in the United States, that in nearly all parts of the country it is carried on, and the animal made to serve as a popular and cheap article of food. The preparation of the meat, however, for commerce on a large scale, is confined mainly to those districts where Indian corn is most profitably raised, and where the winters admit of the process of cure with least expense and greatest certainty. This trade can only flourish where the extremes of heat or cold do not prevail, and is comprised principally

within the region of country between the 35th and 45th degrees of latitude, and within the Mississippi valley. Farmers within this region have found the hog to be the best animal into which to condense for market a portion of the products of their farms; the quickest to come to maturity, besides requiring the least skill and labor to handle, hence best adapted particularly to the use of the pioneer, and is that most universally relied upon for domestic consumption and profit.

In quest of articles of cheap food, Europeans, gradually at first, more rapidly of late, have formed an appreciation of provisions of American cure. With increasing demand, necessarily came enlarged competition, both amongst producers and packers, resulting in marked improvements in breeds of hogs, in their preparation for market, and in the reduction of the business of packing to a nearly perfect system, as well as to fixed scientific principles. Within twenty years, especially within the last decade, the whole packing trade has undergone improvements as marked as has been its growth. The relations of supply and demand, though very irregular in a country so large and of such wonderful resources, have come to be more nearly comprehended and adjusted, so that much less risk is now incurred by the packer than in former years. Scarcely a particle of the animal is now wasted in the process of transformation into articles of food or commercial use, and the collateral trade in bristles, lard-oil, stearine, grease, skins, &c., has grown to be scarcely less important than the original one in food was twenty years ago.

The number of hogs which are used in the regular commercial packing business of the country can only, under the present system of statistics, be approximated. For the western States, through the efforts of private enterprise inaugurated in Cincinnati, it has become a matter of quite close calculation; but for the eastern States there are no reliable data on which to base a close computation. Of marketable hogs, such as would average 200 pounds net, it may be fair to estimate that the number packed in the entire country in 1859-'60, and entering into the commerce of the country, was 3,000,000 head, at an aggregate prime cost of \$35,000,000. The cost of packing, transportation, &c., would add to this a value of near \$15,000,000, making a total of about \$50,000,000 capital employed. So many circumstances transpire to cause a variation in one season as compared with another, in the prime cost of the hog and in the expense of packing, that fair averages are difficult to arrive at, and those who engage in the business find that the most extensive experience furnishes but few data for reliable precedents. In great part the business has to be prosecuted each season in the lights of intuition rather than of positive information as to what may be the best policy to pursue. These intuitions, however, have given those engaged in the trade as much stability of position, perhaps, as merchants engaged in any other line of commerce, and causes the very large capital invested in the business to fluctuate now comparatively little.

The greatly increased use of lard for manufacturing oil, has made for it a relatively higher price than for other parts of the hog, in which the discovery of petroleum and its rapid adoption as a luminating and lubricating material seems to have produced no essential change. This fact can only be accounted for by the well-sustained demand for candles made from stearine, enabling manufacturers to keep lard-oil in constant competition with all similar articles, and to find their profit in the stearine. The future of the trade promises a growth rapid as the past. An increasing manufacturing population and constant large augmentation of laboring force from foreign emigration, the yearly increasing acceptability of American packed provisions as articles of cheap food in foreign countries, all unite in assuring a consumption that will grow in equal pace with the production, and maintain for the pork trade its prominent position among the great commercial interests of the country.

#### THE GRAIN TRADE OF THE UNITED STATES.

The grain trade of the United States, viewed in all its features, is one of the chief marvels of modern commercial history. To trace its rise and progress would be almost to complete a record of the development of this entire continent, for it has been the leading agency in the opening up of seven-eighths of our settled territory. First, in the march of civilization, came the pioneer husbandman, and following close on his footsteps was the merchant; and after him were created in rapid succession our ocean and lake fleets, our canals, our wonderful network of railroads, and, in fact, our whole commercial system.

The grain merchant has been in all countries, but more particularly in this, the pioneer of commerce, whether we refer to the ocean or the inland trade, and not till he was established could other commercial adventurers find a foothold. The commercial history of the United States is based mainly on breadstuffs—staples always marketable at some quotation wherever the human family dwells.

The exportation of American products to foreign countries continues to form one of the chief characteristics of our national commerce. The development of our agricultural resources, and the increasing demands of Europe, particularly England, for foreign breadstuffs, seem to have continued at pretty regular pace. As the production of the United States increased, new and more extensive markets were thrown open—illustrating a grand design of Providence in thus developing a New World to feed the rapidly increasing populations of the Old, and supply homes for their redundant numbers. For upwards of a quarter of a century the extension of the manufacturing interests of Great Britain has been gradually but surely rendering that country more and more dependent upon other nations for the breadstuffs with which to feed her people; and from a grain-exporting country, as she was only half a century since, she now finds herself in a position in which she has to import annually from nine to fifteen millions of quarters of grain. Had that country twenty-five years ago been as dependent as she is now upon other nations, with the grain resources of that period, there would have been much suffering among the poorer classes everywhere; while on the other hand, without this European demand for the grain produced in the United States, the same inducements for opening up the fertile lands of the western States would not have existed. Capitalists would not have been encouraged to construct our immense canals, and lines of railroads, nor to have built our fleets of grain-carrying vessels to traverse the lakes and seas. The steady and increasing demand for American breadstuffs in Europe, however, greatly stimulated the production—made the unbroken and wild, yet fertile wilderness and prairie attractive to the agriculturists of all countries, and created a commerce for which history has few parallels. At the same time it has enriched our country beyond all calculation, enabled us to pay our European debts, given us an enterprising population, drawn from the industrious classes of every nationality, state, or kingdom in the Old World, and has endowed millions of human beings with wealth and the rights and privileges of free institutions.

Commencing at an early period with the scant products of the Atlantic States, the grain trade was gradually pushed up the Hudson river as far as navigation would permit; and where that ceased, the Erie canal commenced and carried it to the great lakes. It was on the completion of this great achievement that the real history of the grain trade of the United States began. Then it was that our "inland seas" became the highway of a commerce which has already attained a magnitude surpassing that of many of the oldest European nations. Then it was that the vast territory west of the lakes, hitherto the home of the "red man," and range for the buffalo, became the attractive field for the enterprising pioneers of industry and civilization, who laid the foundations of what are now seven large and flourishing States of the Union, peopled by a population vigorous and hardy, and well calculated to succeed either in the arts of peace or war.

At the same time, the grain trade was steadily progressing up the Mississippi river into the heart of the west, and on whose banks were built large and flourishing cities, the great depots for nearly a quarter of a century for the products of the rich valley of that river.

The grain trade has progressed, year after year, from small beginnings, till now it has become one of the leading interests of the country, and among the most important in its influence on the world, as on it depends much of the peace, happiness, and prosperity, not only of the people of the United States, but also of many of the kingdoms of Europe.

#### THE EXPORT GRAIN TRADE.

To demonstrate the magnitude of this trade, the following tables are appended, showing the total exports of grain and flour from the United States to foreign countries during the years 1862 and 1863:

## INTRODUCTION.

cxxxvii

TABLE A.

*Exports of grain and flour from the United States to foreign countries for the year ending June 30, 1892.*

WHITTEK EXPORTED.	INDIAN CORN.		INDIAN MEAL.		RYE MEAL.		WHEAT.		WHEAT FLOUR.		RYE, OATS, &c.

# INTRODUCTION.

CXXXIX

Reducing the flour and meal to bushels, the total exports of grain during the past two years, as given in detail in the foregoing tables, compare as follows:

Years.	Bushels.	Value.
1862 .....	76,309,425	\$83,692,812
1863 .....	77,396,082	88,597,064

Of this amount there were shipped to Great Britain and Ireland alone, for the year ending June 30, 1862, 34,102,735 bushels, and in 1863 47,082,026 bushels. The total value of the grain exported to Great Britain in 1862 was \$47,916,266, and in 1863 \$56,059,360. When it is taken into consideration that in 1825 the total value of the grain and flour exported from the United States to all foreign countries amounted to only \$5,274,241, some idea may be formed of the rapid growth and development of this trade.

The progress of the early export grain trade of the country is demonstrated by the following table, showing the exports of grain and flour from the United States to foreign countries each year from 1790 to 1817:

TABLE C.

*Exports of flour and grain from the United States to foreign countries from 1790 to 1817.*

From 1790 to 1817, the period embraced in the foregoing table, the grain exported from the United States was chiefly the product of the Atlantic States. Vermont exported flour and grain of all kinds. New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina,

## INTRODUCTION.

South Carolina, and Georgia, exported flour, wheat, and Indian corn—the southern States chiefly the latter. In fact, during that period the chief commerce of the Atlantic States consisted in the exportation of grain to Spain, Portugal, and the West India islands; for in those days Great Britain exported more than she imported, as may be inferred from the fact that in 1804 the value of the grain exports to Great Britain amounted to only \$59,120—the nucleus of a trade that in 1863 amounted to upwards of fifty-six millions of dollars.

Before the Revolution the grain trade of the colonists constituted their chief commerce. A considerable quantity of grain was exported to the West Indies, but the principal markets were Spain and Portugal. The exports of wheat, flour, &c., from Pennsylvania for the years 1729, 1730, and 1731, were as follows:

Years.	Wheat, bushels.	Flour, barrels.	Bread, casks.	Value of breadstuffs and flax-seed exported.
1729.....	74,800	35,438	9,730	£62,473
1730.....	38,643	38,670	9,022	57,500
1731.....	53,320	56,639	12,436	68,582

In 1739 South Carolina exported 20,165 bushels of Indian corn and peas. In 1742 the price of wheat in New York was 3s. 6d. per bushel.

The following table shows the amount and value of the flour and grain exported from the United States to foreign countries from 1849 to 1863:

TABLE D.

*Amount and value of grain and flour exported from the United States to foreign countries, from 1849 to 1863.*

(Compiled from official documents of the United States.)

1842.....	9,878,176	92,090,699	10.6				

The repeal of the corn laws of Great Britain in 1846, greatly encouraged the importation of grain into that country, and since that date the export grain trade of the United States has been steadily on the increase, never falling below thirteen millions of dollars in any one year, and rising as high as eighty-eight millions. The following table shows the ratio of increase in the value of the grain exports each ten years during the past forty years :

	Aggregate value of grain exports each ten years.	Percentage of increase each ten years.
From 1823 to 1833.....	67,842,211	.....
From 1833 to 1843.....	73,303,440	8.0
From 1843 to 1853.....	198,694,871	170.9
From 1853 to 1863.....	512,380,514	158.0

The following tables show the exports of flour and grain from New York, Boston, Philadelphia, Baltimore, and Portland, to foreign countries for a series of years :

From the foregoing table it will be seen that of the imports of wheat into Great Britain and Ireland during the three years named, 37.5 per cent. were from the United States, 15.9 per cent. from Prussia, and 15.5 per cent. from Russia. Of the imports of flour into that kingdom during the same period, 58.3 per cent. were from the United States, and 14.1 per cent. from France.

The following table shows the aggregate imports of wheat into Great Britain and Ireland from the five leading grain-exporting countries during the ten years ending with 1863:

From—	Quarters.
United States.....	12,968,574
Prussia.....	8,340,202
Russia.....	7,186,493
Egypt.....	4,152,230
Canada.....	2,444,505

The following table, furnished by our consul at Odessa, shows the total exports of grain, flour, and meal from Russia, one of the chief grain-exporting countries in Europe, from 1857 to 1862, inclusive:

	From Odessa.	From southern ports.	From all Russia.
Wheat..... bushels..	36,063,030	94,512,072	119,383,762

# INTRODUCTION.

Compared with that of Russia, the grain trade of the United States is but in its infancy, and yet in wheat, flour, meal, and Indian corn, the exports of the United States, during the six years ending 1862, compare favorably with those of Russia, as the following table shows:

*Total exports of wheat, corn, flour, and meal from the United States and from Russia, from 1857 to 1862 inclusive.*

	From United States.	From Russia.
Wheat, bushels.....	99, 181, 325	119, 383, 752
Corn, bushels.....	38, 888, 768	13, 271, 592
Flour and meal, bushels.....	116, 689, 519	5, 766, 780
Total.....	<u>254, 759, 602</u>	<u>138, 422, 124</u>

Deducting the linseed and rape-seed, which do not properly come under the classification, the total exports of all kinds of grain, flour, and meal from Russia, as furnished in the previous table, for six years ending 1862, amount to 261,694,520 bushels, while the exports of wheat, corn, flour, and meal alone from the United States amount to 254,759,602 bushels, as demonstrated in detail in the foregoing exhibit.

## THE INTERNAL GRAIN TRADE.

The exportation of grain to foreign countries, however, does not by any means indicate, the full extent of the grain trade of any country. The progress of the arts and manufactures, and the entire devotion of a large portion of some of the southern States to the cultivation of cotton, tobacco, sugar and rice, have created very attractive home markets in the eastern, middle, and southern States; and, although the export demand is always of great advantage to the agriculturist, it is the certain home market upon which he has mainly to depend. Without this, whenever the export demand falls off materially, as it sometimes does when Europe has extraordinary crops, the agricultural interest would be so uncertain in its character that but few would be willing to engage extensively in the production of the various cereals. This feature of the trade has for many years engaged the attention of leading statesmen, and legislation has been shaped more or less for the last quarter of a century, towards fostering and encouraging the establishment of manufactories of all kinds on this continent, so as to attract labor and capital from the manufacturing populations of the old world, and render us more independent of foreign countries.

That great progress has been made in this direction, the present position of the grain trade fully demonstrates. For instance, in 1860 the single State of Illinois (according to the census returns) produced 23,837,023 bushels of wheat, and the whole amount exported from the United States to foreign countries during the same year (including flour reduced to wheat) was only 17,213,133 bushels. With regard to Indian corn, the value of a home market is even more apparent. In 1860 Illinois produced 115,174,777 bushels, and there was exported during that year altogether only 15,448,507 bushels, a mere fraction of the product of one State.

The following table shows the comparison between the production and the exportation of grain in the United States:

### WHEAT.

	Production. <i>Bushels.</i>	Wheat and flour exported. <i>Bushels.</i>
1850.....	100, 485, 944	7, 535, 901
1860.....	173, 104, 924	17, 213, 133

### INDIAN CORN.

	Production. <i>Bushels.</i>	Exported. <i>Bushels.</i>
1850.....	592, 071, 104	6, 595, 092
1860.....	838, 792, 740	15, 448, 507

Notwithstanding the great increase in the production of grain, the increased population has been gradually diverted from agricultural pursuits to those of manufactures, and the result is that those very States which half a century ago were exporting grain, are now almost entirely dependent on the west for their supply of breadstuffs. The following extract from the message of Governor Andrew to the legislature of Massachusetts at its last session, supplies a clear illustration of this point:

"Foreign statistical writers differ considerably in their estimates of the cereal consumption of nations. McCulloch states the yearly consumption of England at one 'quarter' of wheat, or eight bushels, to each inhabitant. France, feeding more on bread and less on meat, is estimated as high as ten bushels. But New England, consuming largely of fish and other animal food, possibly may not exceed seven bushels to each person. At seven bushels each, her 3,135,293 inhabitants would consume 21,947,601 bushels.

The census of 1860 shows that her own product of cereals was :

Of wheat, only.....	1,077,286 bushels.
Of rye, only.....	1,617,560 "
Of Indian corn, only.....	9,099,570 "

Total yield of cereals grown in New England.....	<u>11,694,445</u> "
--	---------------------

"But Massachusetts, with a population of 1,231,066, produced less breadstuffs in proportion than either of the other New England States. While her population would, at seven bushels each, call for 8,617,462 bushels, her actual production of cereals was :

Of wheat, only.....	119,783 bushels.
Of rye, only.....	383,085 "
Of Indian corn, only.....	<u>2,157,063</u> "

Her total being only.....	<u>2,659,931</u> "
---------------------------	--------------------

"Her residue of breadstuffs, purchased of the region to the north and west, allowing seven bushels for each inhabitant in the year 1860, was 5,952,531 bushels; or, if she consumed at the rate of eight bushels, the computation of English consumption by McCulloch, her purchase must have been 7,183,597 bushels. More than seven-eighths of the whole cereal yield of Massachusetts was Indian corn, of which a very large portion must have been fed to animals. Her proportional purchase, therefore, must have been much larger than the average purchase of New England. The annual consumption of purchased flour by New England, at an estimate which is sustained by the computation which I have already made, is something near 3,500,000 barrels, or more than one barrel to each inhabitant. In the year 1862, more than 800,000 barrels of western and northern flour were sold in Boston for domestic consumption, or three-fourths of a barrel for each person in Massachusetts.

"I venture to affirm that the consumption of western agricultural products within the six States of New England, including flour, grain and animal food, used for the support of man and the forage of cattle, swine, and horses, during the year 1863, reached the value of \$50,000,000, the proportion of which taken by Massachusetts exceeded \$20,000,000."

The opening of the Erie canal to Lake Erie, on the 25th October, 1825, was the commencement of a new era in the internal grain trade of the United States, as it connected the waters of the great lakes with those of the Atlantic, affording a navigable water-course through the entire State of New York. To the pioneer, the agriculturist, and the merchant, this grand avenue developed a new world, and instituted what is now the commerce of the lakes.

The following table shows the total receipts of flour and wheat at tide-water by the Erie and Champlain canals for a period of twenty-nine years :

## INTRODUCTION.

*Total receipts of flour and wheat at tide-water by the New York canals.*

Years.	Flour.	Wheat.	Years.	Flour.	Wheat.

1848.....	3, 130, 575	3, 116, 134	1863.....	1, 560, 800	22, 206, 900
1849.....	3, 262, 096	2, 388, 314			

The following is an exhibit of the total receipts of all kinds of grain at tide-water by the Erie and Chamblain canals for a series of years:

*Total receipts of all kinds of grain at tide-water by the New York canals.*

Years	Grain, bushels.	Years.	Grain, bushels.
1849.....	11, 986, 690	1857.....	16, 142, 310
1850.....	11, 585, 619	1858.....	23, 686, 374
1851.....	16, 762, 613	1859.....	18, 049, 798
1852.....	19, 583, 875	1860.....	41, 122, 100
1853.....	19, 316, 019	1861.....	62, 275, 951
1854.....	23, 796, 038	1862.....	74, 511, 877
1855.....	21, 613, 904	1863.....	66, 713, 000
1856.....	30, 793, 225		

The Mississippi river was the only outlet to the ocean for the entire northwestern territory, comprising now the northwestern States, prior to the opening of the Erie canal in 1825, but the completion of this great work rendered the country west of the lakes attractive to the enterprising populations of the eastern States and of Europe, and the tide of emigration soon began to flow westward. The construction of the Welland and other Canadian canals, a few years later, connected Lake Erie with Lake Ontario, and thus opened another avenue to the seaboard by the St. Lawrence river.

From that period do we date the rise and progress of the northwest, as well as of the internal grain trade. Those counties in Ohio bordering on Lake Erie became settled first, and as late as 1835 that State was the only grain-exporting territory on the lakes, there having passed through the Erie canal on that year 86,233 barrels of flour, and 1,354,995 bushels of wheat, all the product of Ohio. Michigan began to be settled in the early part of the present century, but it is stated in a copy of the Detroit Gazette, dated 1818, that "from four to five hundred farmers, in addition to those already in the Territory, would be needed to supply the demand for breadstuffs for local consumption." The deficiency at that period was made up by shipments from Ohio. From 1825 to 1830 the population of Michigan began to increase very rapidly, and in 1843 the exportation of grain from that State embraced 106,181 bushels of wheat, 2,582 bushels of corn, 275 bushels of oats, and 263,083 barrels of flour.

It was not till about the year 1830, however, that the resources of the fertile territory lying between Lake Michigan and the Mississippi river began to be developed. The first shipment of grain from Lake Michigan, of which there is any record, was made in the year 1836, when the brig John H. Kenzie took on board at Grand Haven, Michigan, 3,000 bushels of wheat for the port of Buffalo.

The first shipment of grain from the western shore of Lake Michigan, of which there is any record, was made in 1838, consisting of only thirty-nine bags of wheat. This was the first shipment of grain from Chicago, a port which in 1863 exported not less than 18,298,532 bushels of wheat and flour, and 54,741,839 bushels of grain of all kinds.

The first shipment of grain from Wisconsin was made at the port of Milwaukee in 1841, consisting of about 4,000 bushels of wheat, which was purchased on Canadian account and forwarded there. The exports of grain and flour from this same port only twenty years later, amounted to 16,817,322 bushels, consisting chiefly of wheat.

In 1848 the Illinois and Michigan canal, which connects Lake Michigan with the Illinois river, was completed. This greatly stimulated the grain trade of the lakes, as it provided a water-course from the heart of the fertile prairies of Illinois to the Atlantic ocean.

The next great step towards the development of the grain resources of the lake basin was made in the year 1849, when the era of railroad communication was inaugurated by the opening of the Galena and Chicago Union railroad to Fox river, which was soon afterwards extended and completed to the Mississippi. In 1852 the receipts of grain and flour by this railroad amounted to 1,658,725 bushels, and in 1863 there were received by the same road 11,395,649 bushels of grain of all kinds.

The success of the Galena railroad soon stimulated other enterprises of the same nature, until now the territory lying between Lake Michigan and the Mississippi river is crossed by about fifteen different lines. The same system of railroads is also being extended west of the Mississippi across the States of Missouri, Iowa, and Minnesota, into Kansas and Nebraska, and it is not improbable that but a few years will elapse before the grain product of these young frontier States will be as large as that of Iowa or Minnesota at present.

The number of miles of railroad built between 1850 and 1860, in six of the western States, was 9,119, as follows;

States.	1850.	1860.	In'ce in miles.
Michigan .....	342	709. 33	457. 33
Wisconsin .....	20	922. 50	922. 50
Iowa .....		679. 75	679. 75
Illinois .....	110. 50	2, 807. 75	2, 767. 25
Ohio .....	576. 25	2, 900. 50	2, 424. 25
Indiana .....	228	2, 125. 75	1, 807. 75
Total miles.....	1, 275. 75	10, 394. 58	9, 118. 83

The rapid progress of the grain trade of the northwest is fully demonstrated by the increase in the commerce of the lakes. As late as the year 1845 the tonnage of the lakes consisted of only 380 vessels of all classes, with an aggregate tonnage of 76,000 tons, while at the close of the season of 1863 there were employed in the carrying trade of the lakes—three-fourths of which consists of the transportation of grain—1,870 vessels of all classes, with an aggregate tonnage of 470,034 tons, valued at \$16,720,800.

The following table exhibits the total tonnage of vessels engaged in the commerce of the lakes during the past six years:

*Tonnage of the lakes during the past six years.*

Years.	Tonnage.
1858 .....	405, 301
1859 .....	392, 783
1860 .....	391, 220
1861 .....	389, 611
1862 .....	454, 893
1863 .....	470, 034

But, rapid as has been the increase in the facilities for the transportation of grain and flour from the west to the east, it is evident, from the high rates of freight that have ruled during the past two or three years, that they are still inadequate to meet the requirements of the trade.

The following table shows the receipts of flour and grain at the port of Buffalo during the past twenty-eight years:

TABLE E.  
*Receipts of flour and grain at Buffalo for twenty-eight years.*

Years.	Flour, barrels.	Wheat, bushels.	Corn, bushels.	Oats, bushels.	Barley, bushels.	Rye, bushels.	Total flour and grain, bushels.

On Lake Michigan, Chicago stands foremost as a general grain-shipping port. The following table shows the shipments of flour and grain from that port during the past twenty-six years:

TABLE H.

*Shipments of flour and grain from Chicago for twenty-six years.*

(Compiled from statistics of the Board of Trade.)

Years.	Flour and wheat, bushels.	Corn, bushels.	Oats, bushels.	Rye, bushels.	Barley, bushels.	Total flour and grain, bushels.
1838.....	78	-----	-----	-----	-----	78
1839.....	3, 678	-----	-----	-----	-----	3, 678
1840.....	10, 000	-----	-----	-----	-----	10, 000

As a grain-shipping port, that of Milwaukee, on Lake Michigan, is the second in importance. The shipments of flour and grain at this port during the past nineteen years were as follows:

## INTRODUCTION.

TABLE I.

*Shipments of flour and grain from Milwaukee for nineteen years.*

(Compiled from statistics of Chamber of Commerce.)

Years.	Flour, barrels.	Wheat, bushels.	Corn, bushels.	Oats, bushels.	Rye, bushels.	Barley, bushels.	Total flour and grain, bushels.

Michigan City.....	15,000	78,000	.....	.....	.....	.....
Total.....	27,879,293	25,820,753	43,211,448	69,489,113	78,218,675	74,710,694

A glance at the figures in the foregoing table fully demonstrates the marvellous progress which has taken place in the grain trade of the northwest. In history, ancient or modern, we may search in vain for a parallel.

The following table shows the entire movement of flour and grain eastward from the western and northwestern States, (including, in this instance, Canada West, whose products intermingle, in a general statement such as this, with those of the United States:)

# INTRODUCTION.

## THE GRAIN TRADE OF THE ST. LAWRENCE RIVER.

The grain trade of the St. Lawrence river has of late years attracted the attention of the leading statesmen and merchants, both of Canada and the United States. The construction of the Welland canal, and the completion of the various Canadian canals around the rapids of the St. Lawrence, provided an uninterrupted water-course from the head of Lake Michigan to Montreal and Quebec.

For many years the trade of this river was confined chiefly to the products of Upper Canada, but the increased production of grain in the northwestern States during the past ten years has so crowded the other avenues to the seaboard that the trade has naturally sought an outlet to the ocean by the St. Lawrence.

The following table shows the receipts of flour and grain at Montreal during the past three years:

*Receipts of flour and grain at Montreal for three years.*

Articles.	1861.		1862.		1863.	
	By Grand Trunk railway.	By Lachine canal.	By Grand Trunk railway.	By Lachine canal.	By Grand Trunk railway.	By Lachine canal.

Barley, " .....	239,829	652,144	709,239
Peas, " .....	.....	.....	754,414

As demonstrative of the nature of the receipts of grain at Montreal, it is necessary to state, that of the 4,970,099 bushels of wheat received during 1863, 1,961,649 bushels were from Milwaukee, and 1,079,772 bushels from Chicago. Of the corn received in 1863, nearly all of it was imported from Chicago, as there was shipped from that port for Kingston not less than 698,375 bushels, where it was transferred to barges and towed down the St. Lawrence to Montreal. Of the exports of grain at Montreal, the oats and barley are nearly all shipped to the United States.

The chief grain-shipping point on the Canadian side of Lake Ontario is Toronto, wherefrom the following table shows the shipments of flour and grain in 1863, with the ports of destination:

*Shipments of flour and grain from Toronto in 1863.*

Shipped to—	Flour.	Wheat.	Barley.	Oats.
	<i>Barrels.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
Oswego.....	14,740	268,001	288,108	40,186
Capo Vincent.....	.....	22,186	.....	.....
Rochester.....	600	2,100	.....	.....
Ogdensburg.....	18,532	6,652	.....	.....
Montreal.....	85,266	353,250	.....	16,963
Quebec.....	750	.....	10,978	.....
Other ports.....	9,664	200,043	.....	.....
Total in 1863.....	120,552	852,202	299,086	57,149
Total in 1862.....	106,219	933,275	219,147	47,382

Besides the above, there were shipped 92,936 bushels of oats—all to Oswego.

From the foregoing table it will be seen that of the 1,949,193 bushels of flour and grain of all kinds exported from Toronto, only 811,251 bushels were shipped to Canadian ports.

So important has the grain trade of the northwestern States become to the Canadians, that it has stimulated the construction, by English capitalists, of the Great Western railway from Detroit river to Lake Ontario and Niagara river, and the Grand Trunk railway from Detroit river to Quebec and Portland. To cheapen the transportation of grain, lines of propellers are established, and constantly run during the season of lake navigation, between Lake Michigan ports and Ports Sarnia, and Collingwood, on Lake Huron, where produce is transferred to cars, which are run across from Lake Huron to Lake Ontario, where it is again transferred to propellers or sailing vessels, which ply, in connexion with the railroads, between Montreal and Lake Ontario ports. Besides the advantage of cheapening freights, it is claimed that this repeated overhauling of grain, particularly in hot weather, is highly effective in preventing it from becoming heated or musty, as is often the case during hot weather, when it is confined closely in the holds of vessels during long passages.

#### DIRECT TRADE BETWEEN THE LAKES AND EUROPE.

During the past ten years various attempts have been made to establish a direct European trade with the lakes, *via* the St. Lawrence river; but it has been more successfully prosecuted in the lumber and stave than in the grain trade. The first direct shipment of grain from the lakes to Europe took place in 1856, when the schooner Dean Richmond cleared at Chicago for Liverpool with a cargo of wheat; but, of about 125 vessels which have cleared from lake ports for the Atlantic ocean since that date, only three or four have been loaded with grain. This failure to establish a direct European grain trade, has been discouraging to merchants, and has led many to despair of ultimate success; but the chief obstacle seems to be the unsuitableness for ocean navigation of the light-draught schooners which are necessarily employed in order to cross the St. Clair flats and pass through the canals. The want of return cargoes to the lakes has also been a serious detriment to the direct trade, and it is only in seasons of extreme depression in the lake trade, that vessel-owners are willing to embark in such long voyages.

To foster the establishment of a direct European grain trade, and also to provide more enlarged facilities for the transportation of the rapidly-increasing products of the west, a variety of measures are being agitated by commercial associations all over the country, as well as by the legislatures of New York and Canada. The following are some of the leading propositions:

*First.* The construction of a ship canal from Georgian bay to Toronto, *via* Lake Simcoe, so as to pass vessels of one thousand tons burden from Lake Huron to Lake Ontario.

*Second.* The construction of a ship canal from Georgian bay to the Ottawa and French rivers, *via* Lake Nipissingue, so as to pass vessels of one thousand tons burden from Lake Huron to the St. Lawrence river.

*Third.* The enlargement of the Welland canal, so as to pass vessels of the size mentioned above.

*Fourth.* The construction of a ship canal around the Falls of Niagara, so as to pass large vessels of deep draught from Lake Erie to Niagara river, and thence to Lake Ontario and the St. Lawrence river.

*Fifth.* The enlargement of the New York canals.

*Sixth.* The construction of a ship canal from Chicago, on Lake Michigan, to LaSalle, on the Illinois river, and the deepening and improvement of that river, so as to allow steamers and vessels of deep draught to pass from the Mississippi river to Lake Michigan.

*Seventh.* The improvement of Fox river, in Wisconsin, so as to connect the Upper Mississippi with Lake Michigan, and allow the passage of vessels carrying large cargoes of grain and other produce from Minnesota and northern Wisconsin.

*Eighth.* The construction of a ship canal from the head of Lake Michigan to Lake Erie, so as to avoid the long passage around the peninsula of Michigan, *via* the Straits of Mackinaw.

Of the four projects connecting Lake Ontario with Lakes Erie and Huron, the three first are Canadian propositions. The accomplishment of either of the two first—the Georgian bay and Toronto or the Ottawa ship canal—would greatly shorten the distance from Lake Michigan to Montreal, and also avoid the St. Clair flats, which would have to be deepened and improved so as to enable ocean vessels of deep draught to pass.

It is feared by many in New York, however, that the construction of a ship canal to the St. Lawrence river would damage the canal interests of that State by diverting a large portion of the grain trade of the lakes from the Erie canal; but when it is considered that the production of grain in the northwestern States increased from 218,463,583 bushels in 1840 to 642,120,366 bushels in 1860, and that of the eight food-producing States west of the lakes, embracing an area of 262,549,000 acres, only about 52,000,000 acres were under cultivation in 1860, and that 26,000,000 acres of that have been broken since 1850, no fears need be entertained that any of the outlets to the ocean will be unoccupied to the extent of their capacity. The only fear is, that we will not keep pace with the increased production by the provision of increased facilities of transportation.

#### THE RECIPROCITY TREATY AND THE GRAIN TRADE.

By the operation of the reciprocity treaty there is a free interchange of the grain products of Canada and the United States, and the free use of the St. Lawrence river for navigation is accorded to the latter. Since this treaty came into effect the grain trade between the two countries has been greatly increased. The following table shows the value of the agricultural products imported into the United States from Canada, and into Canada from the United States, from 1850 to 1861, inclusive:

*Value of imports of agricultural produce into the United States from Canada, and into Canada from the United States.*

Years.	Value of imports into United States from Canada.	Value of imports into Canada from the United States.	Value of imports into United States from Canada.	Value of imports into Canada from the United States.
1850.....	\$2, 706, 362	\$427, 084	1856.....	\$11, 864, 836
1851.....	1, 937, 283	676, 327	1857.....	7, 100, 413
1852.....	3, 277, 929	473, 137	1858.....	5, 740, 305
1853.....	4, 949, 576	668, 113	1859.....	6, 278, 351
1854.....	5, 295, 667	1, 500, 621	1860.....	10, 013, 799
1855.....	11, 801, 435	4, 972, 476	1861.....	9, 580, 165
				5, 172, 588

According to the above table it is evident that, however much the people of the United States may have been benefited by the operations of the reciprocity treaty, it has been more advantageous to the Canadian than to the American agriculturist.

## THE GRAIN TRADE OF THE MISSISSIPPI RIVER.

The grain trade of the Mississippi and Ohio rivers has, for upwards of a quarter of a century, occupied an important place in the commercial history of the United States. In the early part of the present century, before the era of canals and railroads, the tide of emigration forced itself into the valleys of those rivers and laid the foundations of what soon became large and flourishing settlements. Before Chicago, Milwaukee, and Toledo had existence, other than as small trading posts, Cincinnati, on the Ohio, and St. Louis, on the Mississippi river, were comparatively large towns, with a trade and commerce which attracted capital from all parts of the world. The Mississippi river was the natural outlet for this trade to the ocean, and New Orleans became at an early day the only exporting point for the grain products of the west.

The valley of the Ohio river, embracing the States of Ohio, Indiana, and Kentucky, was settled first, and the grain trade of that river proper is therefore the oldest. But the fertile lands of the river tier of counties in Illinois and Missouri soon attracted the attention of agriculturists, and the grain trade of the Mississippi river proper followed; and, as we have shown in a previous chapter, before steamboat navigation had made much progress, the grain was shipped chiefly in rude barges and carefully floated down the Mississippi to New Orleans, where it found a market, and was shipped to foreign ports. And even, at no distant date, all the western grain and flour which found a market in New York or New England was shipped to New Orleans in steamboats, and thence around the Atlantic coast in ocean ships.

The following is an exhibit of receipts of grain and flour at Cincinnati during the past eighteen years:

TABLE I.

*Receipts of flour and grain at Cincinnati for eighteen years.*  
(Compiled from statistics of Cincinnati Chamber of Commerce.)

1861.....	71,678	1,009,201	3,833,911	122,644	552,733
1862.....	36,411	281,645	315,652	22,216	35,348

The following table shows the exports of flour and grain from New Orleans to foreign countries for a series of years:

TABLE O.

*Exports of flour and grain from New Orleans to foreign ports.*

(Compiled from official documents.)

Year ending June 30—	Flour, barrels.	Wheat, bushels.	Corn, bushels.	Rye, oats, &c., value.
1856 .....	251,501	1,006,783	2,941,711	\$67,892
1857 .....	428,436	1,353,480	1,034,402	2,172
1858 .....	474,900	596,442	1,134,147	885
1859 .....	133,193	107,031	111,522	1,020
1860 .....	80,541	2,180	224,382	1,943
1861 .....	21,767	3	60,670	971

A comparison of the foregoing tables with those illustrating the grain trade of the lakes and of the Erie canal, demonstrates the revolution that has taken place in the grain trade of the west. The trade and commerce of the Mississippi river, so far as relates to grain and other produce, has not kept pace with the development of the territory through which it runs, and for which it is the natural highway to the ocean. The old theory that "trade will follow the rivers" has in some respects been disproved. The artificial channels of trade, canals and railroads, have tapped the west and carried its products eastward across the continent. The grain trade of Illinois, Iowa, Missouri, Wisconsin, and even the greater portion of that of Indiana and Ohio, have been diverted almost entirely to the lakes, the Erie canal, the St. Lawrence river, or the six great trunk lines of railroads that lead from the heart of the west to the seaboard. The Mississippi river has been bridged at Rock island, and another bridge is just being completed at Clinton, farther up. The lines of railroads which extend from Lake Michigan to this river are being pushed forward with great rapidity to the Missouri river, and into Kansas and Nebraska, and there is every probability that the grain of these frontier States will also find a market by way of the lakes. Even now grain is being received at Chicago from Kansas and Nebraska *via* the Missouri river, the Hannibal and St. Joseph railroad, and the Chicago, Burlington, and Quincy railroad. As an outlet to the ocean for the grain trade of the west, the Mississippi river has almost ceased to be depended upon by merchants. There are several reasons for this change:

*First.* The risk of damage to grain and flour that may be shipped during the summer months through the southern latitudes of the Gulf of Mexico, as compared with the transportation by the northern routes, viz., around the lakes and through the Erie canal, or *via* the St. Lawrence river. This applies particularly to corn, which is more liable to become heated than any other kind of grain.

*Second.* The uncertainty of river navigation during the summer months, in droughty seasons, and the vexatious and ruinous delays that are apt to occur in consequence.

*Third.* The speedy transportation by railroads and canals on the northern route, as compared with transportation by river to New Orleans, and thence by ocean ships around the Atlantic coast.

*Fourth.* The superior advantages which New York during the past ten or fifteen years has attained as an importing point, as compared with New Orleans, thus offering greater inducements to ocean shipping to trade with New York.

*Fifth.* The rapid growth of the cotton, sugar, and tobacco trade at New Orleans, to the exclusion of almost every other branch of trade and commerce.

A glance at the table of receipts of grain at New Orleans during the six years previous to the blockade of the Mississippi river, as compared with the great movement of grain during the same period eastward by the Erie canal and the St. Lawrence river, shows clearly the diversion which has taken place in this trade. The entire receipts of grain in New Orleans in 1860 amounted to only

5,198,927 bushels, while the receipts during the same year at the single port of Chicago amounted to about fifty million of bushels, while Milwaukee received about ten million. The exportation of grain from New Orleans to foreign countries had also fallen off year by year, till in 1860 the entire amount exported was only 2,189 bushels of wheat, 224,382 bushels of corn, and rye, oats, and small grain to the value of \$1,943, while during the years 1860-'61 there were exported from New York 23,859,147 bushels of wheat, 9,268,729 bushels of corn, and 2,728,012 barrels of flour.

To demonstrate still further the change in the grain trade from the southern to the northern route, the following table is appended, showing the exports of flour and grain from Cincinnati during the four years preceding the blockade of the Mississippi river; with the amount shipped by the southern and the amount shipped by the northern route:

TABLE P.

*Shipments north and south from Cincinnati for four years.*

Articles.	1857-'58.		1858-'59.		1859-'60.		1860-'61.	
	Shipped south.	Shipped north.	Shipped south.	Shipped north.	Shipped south.	Shipped north.	Shipped south.	Shipped north.
Flour, barrels . . . .	162,565	445,650	17,569	544,570	92,919	385,389	158,592	268,033
Wheat, bushels . . . .	39,446	601,214	1,182	270,531	11,341	310,154	47,801	477,264
Corn, sacks . . . . .	1,927	17,225	3,707	24,796	23,640	25,227	105,332	21,947

It is also to be noted, that of the amount shipped south, as given in the above table, but a very small proportion reached New Orleans. For instance, in the year 1860, of the 478,308 barrels of flour exported from Cincinnati, only 35,146 barrels were shipped to New Orleans, the balance having been shipped north or to other ports on the river between Cairo and New Orleans.

It is worthy of mention, however, that, although the export grain trade of New Orleans has not kept up with the production of the valley of the Mississippi, the local river trade greatly increased in consequence of the extraordinary demand by cotton and sugar planters, who were every year becoming more dependent upon the northwestern States for their supplies of breadstuffs.

#### THE GRAIN TRADE OF THE UPPER MISSISSIPPI.

The grain trade of the Upper Mississippi is a very important branch of northwestern commerce. The rapid development during the past five years of the resources of northern Iowa and Wisconsin, and of Minnesota, has built up large towns on the river, such as McGregor, Winona, Hastings, and St. Paul, on the Mississippi, and Stillwater and Hudson, on the St. Croix, all of which are depots for the grain of the surrounding territory, which is shipped in steamboats and barges down the Mississippi river to Lacrosse, Dunleith, and Fulton, where it is transferred to railroads and shipped to Lake Michigan ports. It is estimated that during 1863 the receipts of wheat alone, for the Upper Mississippi river, at Lake Michigan ports, was not less than six millions of bushels.

#### THE GRAIN TRADE OF CALIFORNIA.

One of the most wonderful features of the grain trade is its growth and development on the Pacific coast. California, which but a few years since was entirely dependent upon western South American ports for a supply of breadstuffs, appears now on the records as a grain-exporting State, and almost every mail from the Pacific conveys intelligence of one or more ships, loaded with wheat, having sailed from San Francisco for Liverpool or London. Riches, other than gold, have been found on the soil, as the excellent quality and heavy yield of California wheat and other cereals, fully attest.

The following table shows the exports of flour and grain from the port of San Francisco to foreign countries from the year 1856 to 1861, inclusive:

TABLE Q.  
*Exports of grain and flour from San Francisco to foreign countries.*

#### VINEYARDS AND WINE MAKING IN THE UNITED STATES.

In the first settlements on this continent, the grape-vines found indigenous, were esteemed among the most valuable productions. In "Force's Collection of Historical Tracts"—1620 to 1760—frequent allusion is made by the writers to our native grapes and to the wine made from them. According to Sir John Hawkins, wine was made in Florida in 1564. A vineyard was established in Virginia in 1620, also in 1647. In 1651 premiums were offered in Virginia for the production of wine. In 1664 a vineyard was planted near New York by Paul Richards, and in 1683 and 1685 attempts were made at Philadelphia, but failed. At a later period Mr. Tasker, of Maryland, and Mr. Antil, of New Jersey, were more successful. These, however, were mere experiments. There is no evidence that wine was produced in any quantity worth naming, until the close of the last and the beginning of the present century. About this period vineyards were planted in various parts of the Union, near the cities of New York and Philadelphia; near Lexington and Glasgow, Kentucky; Cincinnati, Ohio; Vevay, Indiana; York and Harmony, Pennsylvania; Baltimore, Maryland; and in some parts of North and South Carolina, Georgia, and Virginia. These plantings were generally in small vineyards of one to five acres, and, unfortunately, most of them with *foreign grapes*, which, proving to be unsuited to our climate, resulted in failures. Those who planted with native grapes did better. In North and South Carolina the "Scuppernong wine," from a native grape, soon became famous, and was praised as a home production worthy of American patronage.

At Vevay, Indiana, Dufour and his Swiss settlers adopted the "Schuylkill Muscadell," a Pennsylvania grape, then erroneously called the "Cape." This grape was found to suit the climate, and made a red wine, that soon acquired a fair reputation, and laid the foundation for wine-growing in the west, with the better varieties that succeeded it.

The celebrated traveller, Volney, "tasted wine made from native grapes at Gallipolis, Ohio, in 1796," and Dufour, in 1799, "found a Frenchman at Marietta, Ohio, who made a few barrels of wine every year from grapes collected in the woods, equal to the wine made near Paris." Dufour further remarks: "None of the different and numerous trials which were made in several parts of the United States that I visited in 1794, were found worthy the name of vineyards." "I went to see all the vines growing that I could hear of, even as far as Kaskaskia, on the Mississippi, where I was informed the Jesuits had planted a vineyard shortly after the first settlement of the country, but that the French government had ordered it to be destroyed, for fear that vine culture might spread in America and hurt the wine trade of France." "I found only the spot where that vineyard had been planted, in a well-selected place on the side of a hill, under a cliff to the northeast of the town. No good grapes were found there or in any gardens of the country."

Dr. Daniel Drake, in an address on "The Early Physicians, Scenery, and Society of Cincinnati," states that "Third street, running near the brow of the upper plain, was on as high a level as Fifth street is now. The gravelly slope of that plain stretched almost to Pearl street. On this slope, between Main and Walnut, a French Political exile, M. Mennesieur, planted, in the latter part of the last century, a small vineyard. This was the beginning of that cultivation for which the environs of that city have since become so distinguished. I suppose this was the first vineyard cultivation in the valley of the Ohio." The well-known naturalist, F. A. Michaux, in his travels through the United States in 1802, "visited the vineyard near Lexington and found but one variety of grape—a native, doing well, the foreign mildewed." The foregoing extracts afford a fair sample of the pioneer efforts in vineyard culture in the west; they were much like those in the east, and wherever foreign vines were planted disappointment and loss resulted. In the south, owing to its genial climate, the experiments were more successful, but most so with native vines. In 1812 I was first cheered by the sight of a vineyard. It was on the south side of a hill at Rapp's German settlement of Harmony, in Butler county, Pennsylvania. The grapes planted were principally native varieties, the most of them "Schuylkill." Five years later I visited the vineyard of the Swiss colony, at Vevay, Indiana, where the same grape was the favorite. At the former the vines were planted in 1808, at the latter in 1806. The product was a red wine, resembling claret, but rather too harsh for the American palate. Still it was received with favor as a home production, giving promise of great results in the future.

I now come to a period when the second class of pioneers in this cultivation were more fortunate than their predecessors, and, with other grapes, produced better wines. About the year 1820 Major John Adlum, of Georgetown, D. C., first brought the Catawba into notice as a wine grape, and Thomas McCall, of Georgia, Mr. Herbemont, and other gentlemen of the south, the Warren, Herbemont, Madeira, and other varieties which have since proved so valuable.

To Major Adlum belongs the honor of introducing the Catawba, and so high was his appreciation of this grape that he wrote to Mr. Longworth, of Cincinnati, that he believed he had conferred a greater favor on his country than if he had paid off the national debt; in which, after a trial of the grape for wine, Mr. Longworth agreed with him.

The memory of the late Nicholas Longworth, of Cincinnati, will ever be held in the highest esteem by the wine-growers of our country, as he was the father of successful vine culture in the west. By a large expenditure in money in his various experiments with both foreign and native grapes, during a period of forty-three years, he at last succeeded in producing sparkling and still wines highly creditable to himself and the country, and the practical knowledge he acquired from year to year was liberally made known through the public prints for the benefit of all.

The late John J. Dufour, of Vevay, Indiana, is also entitled to the grateful remembrance of the people of the United States for his early and persevering efforts in the cultivation of the vine in this country of his adoption. For thirty years succeeding the introduction of the Catawba grape, the large emigration of Germans into the Ohio valley, many of them from the wine districts on the Rhine, furnished practiced and willing vine-dressers, who were glad to have the opportunity of trying their skill in this new country with a grape so promising. Numerous vineyards were planted in the western States, in localities supposed to be favorable, especially in the vicinity of Cincinnati, and in 1850 Catawba wine, produced in hundreds of thousands of gallons, had acquired a high reputation as a rival of Rhenish wine, and became an article of export to our eastern cities. The cultivation had spread over all the western and southwestern States, and we thought then, as we do now, that wine-growing would eventually be ranked amongst our most important agricultural interests. This the next generation may possibly realize.

Vineyard culture in the United States may now be considered as fairly established. Wine is made in thirty of the thirty-four States of the Union, of different qualities of course, and with varied success. As to its future production in quantity, I should name, first, California; second, the mountainous districts of the southern States, as most favorable on account of the climate; third, the Ohio and Mississippi valleys; fourth, the middle States; and last, the eastern. As to quality, the best samples have

been found in Georgia and the Ohio valley. The impression is, that in the middle and eastern States the climate is too cold to elaborate sufficient saccharine matter in the grape to make a wine that will keep without the addition of sugar. But this may prove a mistake—new varieties may yet be produced to suit each section of our country where the grape is grown. They are now numbered by hundreds, and new hybrids are annually added to the lists. After all our experience during the last seventy years, vine culture in the United States is but yet in its infancy, and we have much to learn. The few millions of gallons which we produce annually, are as nothing when compared to the nine hundred millions of France, or the three thousand millions of all Europe. The vineyards of Europe are estimated at twelve millions of acres. We have far more grape territory than that in the United States; but our climate, with the exception of California, is less equable. In California alone, it is stated, there are five millions of acres well adapted to grape culture. Here is something to reflect upon, and to give hope for the future.

## CULTIVATION.

Vineyards are usually planted on hills, or rolling uplands; such positions are chosen on account of the natural drainage, which is considered essential. Porous soils are preferred to stiff clay, or such as are retentive of water. No trees should be permitted to grow within one hundred feet of the vineyard, nor should any crop be cultivated in it, as the vine is a selfish plant, and demands all the ground for its own use. The ground is prepared for planting by trenching with the spade two feet deep, or by breaking up with a subsoil and common plough 18 or 20 inches; the latter is much the cheapest, and always adopted where the situation of the vineyard permits. In planting the vines, the distance apart in the rows appears to vary in different localities. Around Cincinnati and in the Ohio valley, 3 by 6 is the usual distance; on the shores of Lake Erie, 6 by 8, and 8 by 8; and in California, 8 by 10 is recommended as the proper distance. The object in this country, where labor is dear, is to cultivate with the plough where it can be used, and to avoid the spade, which is expensive. Vineyard-planting is a system of dwarfing the vine, but with our long-jointed and rampant-growing native vines it may be an error to plant too close, or to prune too severely. Our European vine-dressers, accustomed to short-jointed vines, naturally fall into that error here, but they are now correcting it.

The method of training also varies with localities. In the Ohio valley and the southern States the single stake to each vine, and the bow system, is adopted. On the lake shore, and in California, the trellis is used, the vines being trained on it horizontally.

The estimated average annual yield of good vineyards in the west is about that of France—200 gallons to the acre. In the south they claim 500, and in California 800; these latter I consider too high. A bushel of grapes—fifty pounds—will make three and a half gallons of good wine, and a half gallon inferior. In a mere sketch like this article, it is only intended to impart general information on the subject of which it treats; the reader is therefore referred for special directions as to setting out the vines, spring and summer prunings, cultivating the ground, and securing the crop, to the several treatises on grape-culture and wine-making recently published. But I may remark, in brief, that a free exposure to the wind, with the bunches of grapes sheltered from the hot sun by the leaves of the vine, tying neatly to the stake or trellis, a judicious shortening in of superfluous branches, and the keeping the ground cultivated and free from weeds, is considered essential.

*Disease, insects, and frost.*—The grape, like other fruits, has its enemies. The most destructive of these is the mildew or rot. Was it not for this disease the Catawba would be immensely profitable; but of late years, in the Ohio valley, it has destroyed from one-fifth to four-fifths of the crop in many vineyards, and discouraged some persons from planting that fine grape. A sudden change of weather from hot to cold when the vine is in rapid growth, and the seed in the berries about hardening, is sure to produce rot. A free under-drainage—either natural or artificial—and a full exposure to the wind, will in part prevent it. No system of pruning or cultivation has yet proved a sufficient remedy in vineyards. Vines trained against the side of a house, and under cover of the eaves, seldom, if ever, rot. The disease probably results from atmospheric causes, as the rust in wheat.

Insects have not as yet been found very injurious, but the careful vine-dresser will watch closely, and permit none to get colonized in his vineyard. The frost in some localities kills the young shoots of the vine in April, or early in May, but the twin or latent bud will put out, and yield about half a crop. To prevent serious injury by hail, let the bunches of grapes be well sheltered by the leaves of the vine, which will also prove a protection from the hot sun.

#### VARIETIES OF GRAPES FOR THE VINEYARD.

These are now quite numerous, and every year adds more to the list. It will only be necessary to name a few of the most popular varieties, and—

1. *Catawba*.—Nine-tenths of all our vineyards in the west and southwest are planted with this fine grape. With all its liability to rot, it continues a favorite.

2. *Delaware*.—This hardy and delicious table grape promises to rival the *Catawba* for wine. It is becoming popular with some of our best cultivators. The wine is light and delicate, and preferred to the *Catawba* by many good judges. The *Delaware* is less subject to rot than that variety.

3. *Herbemont* makes an excellent wine, but the vine is not hardy enough to be much planted.

4. *Norton's Seedling*.—A hardy, free-growing vine, but little affected by rot, makes a rich red wine like *Burgundy*, and is becoming quite popular.

5. *Schuykill*.—This old favorite of sixty years ago is now but little planted. The wine resembles claret when well made, but the vine bears light crops. It is almost free from rot.

6. *Isabella*.—Another favorite of former years that is now but little cultivated for wine. It is deficient in saccharine matter to make still wine that will keep without adding sugar to the must or juice; but the sparkling wine from it is delicious.

The Concord, Hartford Prolific, and some of Rogers's hybrids, appear to suit our climate, and to be free from disease, but are not yet fairly tested for wine. Grapes of recent introduction in high credit for northern cultivation are the *Iona*, and *Adirondack*, natives of the State of New York, and the *Creveling*, a native of Pennsylvania. In the south, in addition to the *Catawba*, the *Warren* is largely cultivated, and the *Scuppernon* still holds the favorable reputation it acquired sixty years ago. Other varieties are being tested which it is unnecessary to enumerate here. The varieties in the vineyards of California are said to be foreign or of foreign origin. I have no means of describing or even naming them.

#### WINE-MAKING.

This process is as simple as making cider. The bunches of well-ripened, selected grapes, are mashed by passing through a pair of wooden rollers in a small grape-mill, or by a beetle in a barrel; then poured into the press and the juice extracted. This "must," as it is termed, is put into a clean cask to ferment. A few inches of space is left to allow room for fermentation, and a tin siphon is placed tight in the bung-hole, with one end in a bucket of water, through which the carbonic acid gas escapes, thus preventing a contact with the air from injuring the new wine. In ten days or two weeks the fermentation ceases; then fill up the casks and drive the bungs tight. In March rack off the wine into clean casks. A second but slight fermentation will take place in May, when the bungs should be loosened until it subsides; then fill up the casks and tighten the bungs. The wine is now made, and in autumn will be fit to bottle. The only art in preserving the wine sound is to keep it free from the air by filling up the casks and tightening the bungs every two or three weeks. So important is this, that in Europe they have a quaint proverb: "A man might as well forget to kiss his wife on coming home, as to leave a vacancy in his wine-cask," implying that the omission would turn both sour.

From the refuse grapes, and the last pressing of the good ones, an inferior wine is made by the addition of sugar, and sold at half price. The lees of the wine and the pomace of the grapes are distilled for brandy, which, in three or four years, compares favorably with foreign.

The pride of the wine-grower is to make a good *natural wine* from the pure juice of the grape, without the artificial appliances of sugar or spirits. And, if this "must" or juice weighs over 80° (or 1.080) by the areometer or saccharine-scale, it will do so; if not, then loaf sugar, dissolved in water,

must be added before fermentation. Catawba "must" averages 86°; Isabella, 72°. This is the product of the wine farmer who only makes "still wines."

Sparkling wines are made by the wine merchant or vintner, who purchases the new wine before its second fermentation, fines and bottles it, and, by placing it in deep, arched sub-cellar, usually twenty-five feet under ground, and letting it remain there from fifteen to eighteen months, is enabled to prepare it for market, with the fermentating principle so subdued as not to endanger the bursting of the bottle. Sirup of rock-candy is added to sweeten it, and sometimes a spoonful of brandy to each bottle, to strengthen it. To make this wine right and profitably requires a large capital, and liberal outlays in preparation. This showy and popular wine sells for about double the price of still wines. The great art in making *good* wine is to have the grapes well ripened, and all unripe or imperfect berries picked from the bunch before pressing. The press, casks, and vessels should be perfectly clean. Then, with a good cellar, and the casks kept bung-full and tight, there is no danger. The grapes are not stemmed, the *tannin* in the stems being useful in clearing the wine.

To the foregoing views of Mr. Buchanan, we add the following statement of ex-Governor Downey, of California, on the culture of the vine in that State:

"In the tier of counties extending south from Santa Cruz to the Mexican boundary the grain crop is precarious, the seasons being uncertain, and the wheat subject to rust. Stock-raising and the culture of the vine are the chief employment of the husbandman. The number of vines now bearing in this State is about 4,500,000, and, if well attended, these will yield 4,500,000 gallons of wine; the capacity of our State for this product is beyond conception. The counties of Los Angeles and San Bernardino have now 2,000,000 vines; with increased supply of water for irrigation, they could be increased to 30,000,000. The grape generally cultivated, and as yet the best adapted, is that introduced by the Catholic missions. It is the same that is in general use in Spain, Madeira, and the Canary Islands, from which springs Xerez, or Sherry, and Madeira, or Teneriffe, altered somewhat by the change of climate and soil. There is less change in the process of wine making than in any other branch of modern agriculture, the same old process used hundreds of years since being yet followed by many, with as much advantage as by any modern innovation; and it is as simple as by a cider-mill and press. Our vines, up to the present, are free from disease. The average yield of a well-attended vineyard is 1,000 gallons to the acre, and the vine will bear vigorously until it reaches sixty years of age. One hundred acres of vineyard can be planted, the ground prepared, and attended with as little cost as the same extent of land planted in tobacco: deep ploughing once or twice, harrowing, and laying off the rows six feet apart each way. The cuttings are about two feet long, planted with aid of a crow-bar, and from four to six inches left above the surface. The third year will produce, and at the age of six years, produce profitably. The first year we irrigate frequently, in order to assist the rooting of the vine, and thereafter once or twice annually, according to the soil or relative moisture. I am induced to make these lengthy observations on the simplicity of vine culture from the fact that many are led to believe, from the dissertations and reports of agricultural societies, that the work of planting a vineyard on anything like a large scale must be a Herculean task. They suggest deep spading, (three feet,) and various composts, and a thousand and one fertilizers as adjuncts, which may, in their localities be necessary, but surely not in California, and it is very doubtful if they are in the vine region on the Atlantic side of the continent. Our process of irrigating is a never-failing source of fertility; the salts and earthy matter held in partial solution in running streams, stimulate and enrich the soil, and destroy, in a great measure, all insects and larvæ. It is this natural irrigation of the valley of the Nile that has made it yield its successive crops, from the remotest antiquity, without exhaustion. In this connexion, I would suggest to our farmers and gardeners in the older States, that, when practicable, they should have one field at least that could be irrigated."

INFLUENCE OF RAILROADS UPON AGRICULTURE.

The first impression made on the popular mind by any great improvement in machinery or locomotion, after the admission of their beneficial effect, is that they will, in some way or other, diminish the demand for labor or for other machinery. Hence it was that in Europe the introduction of printing was denounced on account of its supposed tendency to diminish the employment of writers or copyists, and the associations of individuals against its employment, similar to the opposition subsequently manifested to the use of labor-saving machinery in manufactures. It was long before this prejudice could be overthrown, but the subject is now much better understood. It is now established, as a general principle, that machines facilitating labor increase the amount of labor required. This is done chiefly by cheapening the products of labor so that more can be consumed, and ultimately more labor employed. The introduction of cotton and wool machinery was followed by outbreaks of workmen against machinery; yet nothing is more certain than that hundreds of thousands of men and women are employed in the manufacture of cotton who would not have been if machinery had not cheapened cotton cloth so that it could be introduced into general use. So it might be assumed that the introduction of sewing-machines would at once throw many sewing women out of employment; but such is not the fact. Many more sewing women are now employed than there were before the sewing-machine was introduced. In the same way the influence of railroads was at first very much misconceived; even among civil engineers the vast power of steam and of cohesion on the tracks were not understood. On the completion of the Liverpool and Manchester railway, some of the ablest engineers laid it down as a settled principle that railroads would not be able to carry heavy freights, and their business must be confined to the carriage of passengers. It was also considered impracticable to ascend over fifty feet per mile with ordinary locomotives; as a consequence of this theory *inclined planes* were for several years made wherever the grade was over fifty feet. If this practice had continued, it must obviously have proved a great obstruction to the carriage of heavy freight. Time and inventive genius have happily overcome all these difficulties; but still, in this, as in other cases, there was an idea that the transportation of agricultural products would result in diminishing the number of horses, wagoners, and steamboats. Indeed, this would seem a natural, if not a necessary, effect of transporting immense quantities of agricultural produce by a machinery which did not before exist. The result, however, proves precisely the contrary. Horses have multiplied more rapidly since the introduction of locomotives than they did before; and even steamboats, on such rivers as the Ohio and the Mississippi, where the recently constructed railroads have been in direct competition with them, have continued to increase almost without interruption. Before we look at the general results of railroads on the agricultural interests, we will glance at their incidental connexion with the other means of transportation. Take, for example, the increase of horses in connexion with the increase of railroads.

The following is the number and increase of horses in the last twenty years, including mules and asses:

	No. of horses.	Increase.
In 1840.....	4,335,669	
In 1850.....	*4,896,050	12 per cent.
In 1860.....	*7,400,322	51 per cent.

Three-fourths of all the miles of railroad have been made since 1850; and we see that since then the increase of horses has been the greatest. If we pursue this inquiry a little further, we shall find that horses have increased the most in those States in which the greatest extent of railroads has been made since 1850. Take, for example, the number of horses employed in agriculture and for other purposes in the five great States of the west:

° Exclusive of 1,185,514 not employed in agriculture.

*Number of horses employed in agriculture and for other purposes in the five great States of the west :*

States.	1850.	1860.	Increase, per cent.
Ohio.....	466, 820	753, 881	61
Indiana.....	320, 898	502, 069	84
Illinois.....	278, 026	724, 138	160
Michigan.....	58, 576	167, 009	186
Wisconsin.....	30, 335	146, 584	380
Aggregate.....	1, 156, 255	2, 323, 671	106

In these five States there have been constructed since 1850 nearly nine thousand miles of railroad; and yet there we find this extraordinary increase in the number of horses. We do not present this as evidence that the construction of railroads necessarily augments the demand therefor, and therefore increases the number of horses, although we have no doubt that such is the case; but simply to show that railroads have not diminished one of the great elements in competing means of transportation. It must be recollected that only forty years ago the only means of transporting goods and products between the eastern and western States was by wagons, and that the business of transportation in this way was as much a business, on relatively as large a scale, as that of transportation by canal and railway is now. The first great change in this mode of transportation was by the New York and Pennsylvania canal; but the whole business of the canals in the first years of their introduction was small in comparison with that of the railroads now. Hence it seemed that railroads must diminish the number and importance of horses, but such was not the fact; and we shall see in this, as in the case of all animals, that railroads tend to increase their number and value. This is now an established principle, which we shall illustrate in regard to other domestic animals.

Although but slightly connected with the interests of agriculture, we may here state another fact, that since the introduction of railroads, the building and employment of steamboats on our interior rivers have also increased largely, so that, even where railroads have competed directly with them, the steamboat interest has continued to increase in value and importance. This has not been always, we admit, in direct proportion to the growth of the country, but enough to show that, even where competition was greatest, this interest has not been injuriously affected. More than double the number of steamers were built on the waters of the interior west in 1861 than were in 1850.

We advance these facts, not so much to show the direct and positive influence of railroads on agriculture, as to show that there is no interest of agriculture and commerce that railroads have injured, even, when upon the most plausible theories, such results were anticipated.

We now proceed to show the positive advantages which all departments of agriculture have derived from the construction of railroads. So great are their benefits that, if the entire cost of railroads between the Atlantic and western States had been levied on the farmers of the central west, their proprietors could have paid it and been immensely the gainers. This proposition will become evident if we look at the modes in which railroads have been beneficial, especially in the grain-growing States. These modes are, first, in doing what could not have been effected without them; second, in securing to the producer very nearly the prices of the Atlantic markets, which is greatly in advance of what could have been had on his farm; and, third, by thus enabling the producer to dispose of his products at the best prices at all times, and to increase rapidly both the settlement and the annual production of the interior States. A moment's reference to the statistics of internal commerce will illustrate these effects so that we can see the vast results which railroads have produced on the wealth and production of the country.

1. If we examine the routes and tonnage of the trade between the Atlantic cities and the central western States, we shall find some general results which will prove the utter incapacity of all other modes of conveyance to carry on that trade without the aid of railroads. Between Lake Erie on one

side and the Potomac on the other, the commerce between the east and west is altogether carried on by way of several great arteries, which are these, viz: the Erie canal, the Oswego canal, the Champlain canal, the Central railroad, the Erie railroad, the Pennsylvania railroad, and the Baltimore and Ohio railroad. There are no other great channels of conveyance between the east and the west, and in fact no other routes appear practicable. However large an amount of product or merchandise may be carried by the lakes, it must be shipped to or from Buffalo, Oswego, or Ogdensburg. However multiplied may be the routes by rail or canal, by which products may arrive at Buffalo, Pittsburg, Wheeling, or Parkersburg, all the freights carried over them going east must pass over these great routes. We have, therefore, the means of determining accurately the relative transportation by different routes and modes. The different modes are all reduced to two—canals and railroads. The proportion of tonnage on these several lines of conveyance, as reported in 1862, was as follows:

CANALS.		Tons.
Erie canal.....	2, 500, 762	
Oswego canal.....	862, 920	
Champlain canal.....	650, 000	
Aggregate.....	<u>4, 003, 682</u>	

But, we must observe that the Oswego canal joins to the Erie canal, and its tonnage, arriving at or leaving Albany, is included in that of the Erie canal. In fact, the tonnage of the canals, which is counted at Albany, is only that of the Erie and the Champlain, and of the latter but a small portion goes to or from the west. We have at the utmost, then, the carriage on canals between the Atlantic cities and the west of 3,150,000 tons.

RAILROADS.		Tons in 1862.
Pennsylvania railroad.....	1, 792, 064	
Erie railroad.....	1, 632, 955	
New York Central railroad.....	1, 387, 433	
Baltimore and Ohio (estimated).....	1, 200, 000	
Aggregate tonnage of these lines.....	<u>6, 018, 452</u>	

We observe that in 1862 the tonnage of the six great arterial lines of transportation between the east and west amounted to over nine millions of tons, of which only one-third were carried by water. We must recollect that this was the case when the Erie canal of New York had been enlarged and refitted with the express purpose of transporting the products of the west, and was supplied with five thousand canal-boats. It is evident, therefore, that railroads not only carry two-thirds of the freights to and from the west at the present time, but that such is the rapid increase of western products, and the surplus carried to Atlantic or foreign markets, that the time is near when all that can be carried by water will be but a small proportion of the whole. The transportation by wagons is no longer possible to carry the surplus products of the interior States to either foreign or domestic markets. In fine, in the absence of railways the cultivation of grain beyond the immediate wants of the people must cease, or the surplus perish in the fields. Such was exactly the state of things in the west before the general introduction of railroads. The great grain-fields of Ohio, Indiana, Illinois, and beyond the Mississippi, have been mainly cultivated because railroads made their products marketable and profitable. In one word, railroads did what could not have been done without them.

2. Railroads secured to the producer very nearly the prices of the Atlantic markets, which was greatly in advance of any price which could possibly be obtained in western markets. It might be supposed that if the carriage of a bushel of grain from Sandusky to New York was reduced from forty cents a bushel to twenty cents, the gain of twenty cents would inure, in part at least, to the consumer; but experience shows this is not the fact. This gain of twenty cents inures to the producer. In proof

of this it will be sufficient to adduce two or three well-known facts. The prices of flour and meat at New York (estimating them at the gold standard) have not been reduced in the least, notwithstanding the immense quantities of the products of grain imported into that city. On the other hand, the prices at Cincinnati, on the Ohio, have doubled, and in some articles, such as pork, have trebled. The great bulk of the gain caused by the cheapness of transportation has gone to the producer. This depends on a general principle, which must continue to operate for many years. The older a country is, the more civic and the less rural it becomes; that is, the greater will be the demand for food, and the less the production. The competition of the consumer for food is greater than that of the producer for price. Hence it is that Europe, an old country, filled with cities, makes a continual demand on this country for food. Hence it is that New England and New York, continually filling up with manufacturers, artisans, and cities, must be supplied with increased quantities of food from the interior west; and hence, while this is the case, prices cannot fall in the great markets. Hence it is that the cheapening of transportation inures to the benefit of the agricultural producer. New England consumes more than a million barrels of western flour. The transportation is cheapened a dollar per barrel, and thus, in New England alone, in the single item of flour, a million of dollars, net profit, is put into the pockets of the western farmer by the competition of railroads; for a large portion of this flour is carried over the Massachusetts Western railroad. It is entirely true that the manufacturer of New England shares, on his side, in the gain of cheap transportation; but we are here considering simply the influence of railroads on agriculture.

In the western markets the gain to the farmer is palpable in the enhanced prices of every article. At Cincinnati, in 1848 and 1849, (which was the beginning of the greatest railroad enterprises,) the average price of hogs was \$3 per hundred. In 1860 and 1861 it was double that, and has continued to increase. This was a net gain to the farmers of Ohio alone of from three to four millions of dollars. In the entire west it was a profit of more than twenty millions on this single animal; for, if there were now no railroads, this product could not be carried to market except on foot, which would take away half the value. No further illustration of this point need be made. Take the market prices of New York and Boston, on the Atlantic, and of St. Louis and Cincinnati, in the west, at an interval of twenty years, and it will be seen that the cheap prices of the west have gradually approximated to the high prices of the east, and this solely in consequence of cheapening the cost of transportation, which inures to the benefit of the farmer.

3. By thus giving the farmer the benefit of the best markets and the highest prices, railroads have increased the agricultural productions of the interior States beyond anything heretofore known in the world. We have already shown that this increased production, or rather its surplus, could not have been carried to market without the aid of railroads, more than two-thirds of the whole being carried off by that means. Let us now reverse this operation, and we find, on the other hand, that railroads have stimulated and increased production. The northwestern States are those in which the influence of railroads on agriculture is most obvious. In the five States of Ohio, Indiana, Illinois, Michigan, and Wisconsin there were comparatively few miles of railroad prior to 1850; but from 1850 to 1860 the construction of roads was most rapid. In 1850 there were only 1,275 miles of railroad in those States, but in 1860 there were 9,616 miles. Let us now examine the products of those States in 1850 and 1860, and see how the progress of railroads has sustained and stimulated agricultural production. The following table shows the increase of the principal vegetable and animal production in the five States of Ohio, Indiana, Illinois, Michigan, and Wisconsin in the ten years from 1850 to 1860:

	In 1850.	In 1860.	Increase per cent.
Wheat.....	39, 348, 495 bushels.	79, 798, 163 bushels.	100
Corn.....	177, 320, 441 "	280, 268, 862 "	58
Oats.....	32, 660, 251 "	51, 043, 334 "	50
Potatoes.....	13, 417, 696 "	27, 181, 692 "	100
Cattle.....	3, 438, 000 "	5, 371, 000 "	59

This increase is decidedly beyond that of the population; showing that the products of agriculture are, in those States, profitable. The aggregate of grain products in those States was:

In 1850 .....	*255, 240, 444 bushels.
In 1860.....	*422, 369, 719 "

What part railroads have had in carrying this product to market we shall see by† ascertaining the surplus, and the manner in which it was transported. The commissioner of statistics for the State of Ohio, in his report to the legislature of Ohio, estimates (in the actual carriage of railroads and canals) that *three-fifths* of the value of agricultural products of Ohio are exported, excepting, of course, pasturage, fruits, garden products, &c. In 1859-'60, twelve millions of bushels of wheat were exported from that State, and an equal proportion of corn, reduced into other forms, such as fat cattle, hogs, pork, lard, whiskey, cheese, &c. Three-fifths of the aggregate grain production of these five States (1860) will give two hundred and fifty millions of bushels of grain. This is vastly greater than the whole tonnage of canals and railroads, and would, therefore, seem incorrect. This, however, is not so. The heaviest article (corn) is reduced to a fourth, perhaps, less weight by being changed into whiskey, pork, and cattle. The same is true of oats, and thus the ten millions of tons represented by the canals and railroads may cover all the surplus which finds the extreme eastern markets. A large quantity of the surplus products of these States is consumed in way-markets. We see now, that, since railroads carry two-thirds of this immense export, they represent nearly or quite the same proportion of the capacity of those States to raise any surplus, and therefore two-thirds of the profit made upon it. If we now consider the question of the profits of agriculture, the case becomes still stronger. The actual cash value of the products carried to market from these five States (that is, the surplus) is two hundred millions of dollars, and it is safe to say that one-half this sum is due to the influence of railroads. There are some interesting facts on this subject, to some of which we will briefly allude. Take, for example, the prices of both products and lands in the interior States, and compare them at different periods. Forty years ago (1824-'25) the surplus products of Ohio had already accumulated beyond the means of transportation. In consequence of this fact, wheat was sold in the interior counties, for 37 cents per bushel, and corn at 10 cents. After the New York canal (Eric) was finished, in 1825, and the Ohio canals several years later, these prices were raised more than fifty per cent.; but when two or three of the main railroad lines were finished in 1852-'53, the rise in prices and the amount carried forward to the eastern markets were even more increased. To show, in some measure, the effect of the improved means of transportation on the value of produce in the interior, we make the following table of prices at Cincinnati at several periods:

	In 1826.†	In 1835.	In 1853.	In 1860.
Flour.....	\$3 00 per barrel.	\$6 00	\$5 50	\$5 60
Corn.....	0 12 per bushel.	0 32	0 37	0 48
Hogs.....	2 00 per cwt.	3 12	4 00	6 20
Lard.....	0 05 per pound.	0 08	0 08½	0 11

We find that in 1860 the price of flour was nearly double that of 1826; the price of corn nearly four times as much; the price of hogs three times as much, and the price of lard double. From 1835 to 1860, (when the railroads were completed,) under the influence of railroad competition with canals the price of corn advanced 50 per cent., and that of hogs 100 per cent. Perhaps no articles can be selected which furnish a more complete test of the value and profits of farming in the States of the northwest than that of these staples, corn and hogs.

But there is another respect in which the influence of railroads is almost as favorable to agriculture as that of cheapening the transportation of produce. It is that of cheapening the transportation, and therefore reducing the prices of foreign articles and eastern manufactures consumed by the farmers of the interior. We need not adduce tables to illustrate this; for it is quite obvious and well known

\* Includes wheat, rye, corn, oats, barley, and buckwheat.

† Edward D. Mansfield.

‡ The prices of 1826 are from "Drake & Mansfield's Cincinnati, 1826."

that this has been the effect, though perhaps not to so great an extent as the reverse, in the case of produce. In 1839-'40 sugar was just the same price as in 1857 and 1858; but the average price of coffee from 1833 to 1838 was three cents higher than it was from 1853 to 1860. On the whole, the prices of articles carried from the east to the west were diminished, while those from the west to the east were increased. Again, the influence of railroads on the value of farming lands is too great and striking not to have been noticed by all intelligent persons. We have, however, some remarkable instances of the specific effect of certain railroads; we have, for example, the immediate effect produced on the lands of Illinois by the Illinois Central railroad. That company received from the government a large body of land at a time when the government could not sell it at a dollar and a quarter (\$1 25) per acre. Since then the company has constructed its road and sold a large part of those lands at an average of \$11 per acre, and the greater part of the lands of Illinois is fully worth that. Notwithstanding the rapid growth of population, the larger part of this advance is due to railroads. The following table shows the advance (by the census tables) of the cash value of farms in the five States mentioned in the ten years from 1850 to 1860:

	1850.	1860.
Ohio.....	\$358,755,602	\$666,564,171
Illinois.....	96,133,290	432,531,072
Indiana.....	136,385,173	344,902,776
Michigan.....	51,872,446	163,279,087
Wisconsin.....	28,528,563	131,117,082
Aggregate.....	671,678,075	1,738,394,188
Increase in ten (10) years.....		<u>\$1,066,716,113</u>

It is not too much to say that one-half this increase has been caused by railroads, for we experience already the impossibility of conveying off the surplus products of the interior with our railroads. Putting the increase of value due to railroads at a little more than one-third, we have four hundred millions of dollars added to the cash value of farms in these five States by the construction of railroads. This fact will be manifest if it is considered that the best lands of Illinois were worth but a dollar and a quarter per acre prior to the construction of railroads, and are now worth twenty dollars.

We need not pursue this subject further. If the effect on the central western States has been so great, it is still greater in the new States which lie beyond the Mississippi. They are still further from market, and will be enriched in a greater ratio by the facilities of transportation. Indeed, railroads are the only means by which the distant parts of this country could have been commercially united, and thus the railroad has become a mighty means of WEALTH, UNITY, and STABILITY.

#### PRESERVATION OF FOREST TREES.

We have endeavored to avail ourselves of all proper occasions, to impress upon our generation the importance of exercising greater care in the preservation of forest trees. It is lamentable, in view of present ruthlessness, and the demands of posterity, to observe the utter disregard manifested by the American people, not merely for the preservation of extensive groves, but the indifference which they exhibit for valuable trees, the destruction of which is not necessary to good cultivation, and the existence whereof would not only add greatly to the value of their property, but contribute vastly to health, the fertility of their farms, and the comfort of their live stock. We have seen thousands of farms rendered less productive and of much less intrinsic value by the destruction of timber, especially on their north and west boundaries, where they protect from the colds of winter, and others made unhealthy by removing the barriers which nature had placed to the encroachments of miasm.

We remember, upon an occasion of remonstrance with a farmer against destroying a beautiful isolated tree in a large field, his foolish reply in extenuation of his labor, that it supplied a resort for the blackbirds which destroyed his corn, nor could he be persuaded that its use by the birds which

protected his fields through a long series of years from insect depredators, much more than compensated for the few corn-hills torn up by the enemy of the grub-worm, nor dissuaded by the representation of its benefits in supplying shade to his cattle. His plea was, that if we had experienced like labor with himself in eradicating the original forest, we would not manifest such fondness for trees. Were the half of that farm now possessed of so much of its "original forest" as might have been preserved, without any restriction of its uses for necessary purposes, it would be worth double the present value of his entire estate, while we doubt not that the other half would have yielded more income than he has derived from the whole, and have increased in value. No one better understood the importance of belts of timber as protection against the inroads of fever, than the judicious and philosophic Dr. Benjamin Rush, of Philadelphia, who in 1798 assigns one cause for "the unusually sickly character of Philadelphia after the year 1778" to the "meadows being overflowed to the southward of the city, and the cutting down by the British army of the trees which formerly sheltered the city from the exhalations of the ground."\*

Dr. Rush refers to the fact of residences in the southern country becoming untenable from like causes—the cutting down of groves near dwellings. Through ignorance and want of taste, labor and expense are thus misappropriated, producing injurious consequences, not only to the present but to future generations. Every well-managed farm should support sufficient timber to admit of an abundant present supply for all necessary purposes of fuel, fencing and building, without reducing the quantity necessary for like uses by posterity, and by the exercise of discretion the amount of land appropriated to this end will be found less than is generally supposed, although, judging from the too-general practice, it would appear as if we presumed that posterity would have but little use for timber. Apart from the increasing value of timber in every section of our country, our farmers do not seem to comprehend that they are destroying that which in a little time would prove the most attractive feature of their estates. Groves restrain the sweeping winds in winter from divesting the surface of that soft and protecting covering and important fertilizer, the snow, the gradual melting of which in spring converts the stones into food for plants, while in the summer they supply an invisible but important moisture to the crops, and in the heated day enable them to enjoy the full advantage of the dews of night, and supply agreeable places of recreation for developing the intellects and bodies of our children, ever associating with their minds through life, recollections of pleasures the happiest of their existence, which made home a place of joyous contentment. And who that has experienced the pleasure, would exchange it for that derivable from other examples of practical operations, the gratification yielded by mature, beautiful forest trees which he preserved, protected, and pruned when they were but unseemly shrubs, especially when his children and their children derive from them their happiest annual enjoyments? He whose farm is destitute of groves should procure or plant them at once, being encouraged by the fact that from the seed, with good attention, he may have nut-bearing chestnut trees in eight years; and while your houses and barns are falling, these will be improving. But in addition to the luxury, ornament, and value of groves, wherever they are cherished with proper attention, they confer a dignity upon their possessor and ennoble the pursuit of agriculture. That was a sage injunction of the dying Scotch laird to his son: "Jock, when ye hae naething else to do, ye may be aye sticking in a tree; it will be growing, Jock, when y're sleeping;" words of wisdom "tauld" him by his father, "sae forty years, sin;" but which he regretfully confessed not to have heeded.

While treating of this subject we cannot refrain from reference to that bad taste, so frequently exhibited, of introducing exotics for ornament, or to supply shade, to the neglect of the beautiful native forest trees, which are so easy to be obtained by all—not that we have any objection to such, under appropriate circumstances, but to adopt them to the exclusion of the more attractive and useful trees with which our forests abound, betrays a want of taste as well as deficiency in judgment.

## \*FRUITS, VEGETABLES, AND WOOL OF CALIFORNIA.

Our orange and lemon crops are becoming of great importance, coming into market or ripening when those raised in the tropics are exhausted. The trees of each of these grow as large as they do in the tropics; the fruit is as good and as sweet, but the rind thicker. We produce the sugar-cane of Louisiana, and it yields profitably; the Chinese sugar-cane does well, but neither these nor the cotton-plant have been cultivated on sufficiently large a scale to enable me to arrive at a conclusion as to their real merits as staple products in this region. A convention of stock-raisers, composed of intelligent gentlemen, met in San Francisco last year. They inform us, from their best source of information, that we have now in the State three millions of horned cattle, a number far beyond the wants of consumption; and there being no market open to us beyond the limits of the State, this branch of industry has become profitless and ruinous. The same will apply to horses. We have vast quantities of inferior stock which have become a nuisance, and which only serve to destroy pasture that might be profitably employed for the maintenance of the Merino sheep.

The capacity of this State for maintaining a large population in proportion to our entire superfiice, is not as great as our number of square miles would suggest. There is but a comparative small proportion that can be cultivated. This is not owing to any want of fertility, but to the absence of rains in the summer, and the scarcity of water for irrigation on a large scale. Our commercial position on the continent, our vast mineral resources, and our unsurpassed climate will always guarantee to California a respectably numerous, but we need never hope for a dense population, such as will swarm the great northwest, "where every rood of land will maintain its man."

Much will be done to extend the present area of cultivation in the State by means of artesian water, damming in the winter to prison the water of mountain streams for summer irrigation, and by improved modes of deep ploughing and subsoiling, which will enable the field to absorb and retain the winter rains.

Vegetables of all kinds are produced in great abundance, and the aid of manures is seldom resorted to. In size and yield they surpass those of the older States, but some contend they are deficient in flavor. This, I think, a mistake, and may be partially accounted for by early and pleasing impressions of home.

Our wool clip will claim, in order of importance, the second rank as a product, adding largely to the material wealth of the State and nation at large, giving to large numbers pleasing and profitable employment, and adding much to our carrying trade. From a few thousand coarse-wooled and inferior Mexican sheep, our flocks will now number three millions of improved stock, yielding this year a clip approximating to 12,000,000 pounds; and, at the close of the present decade, it will not be unreasonable to expect that California will produce an amount equal to the entire product of this staple in the United States in 1860—say 60,000,000 pounds. We are happy to see that your wise and patriotic suggestions in relation to the protection that our wool-growing interests should have and receive are being acted on by Congress. The same rule should apply to the wine-growing interest, and specific, not ad valorem, duties should be the rule, so as to prevent fraud both on the producer and the government.

\* Communicated by Ex-Governor Downey.

## NUMBER OF SLAVEHOLDERS IN THE UNITED STATES.

The last table in the volume would attach more properly to that on population; but, not having been included there, it is deemed more advisable to incorporate it here than to omit it.

In examining this table, the conclusion must not be arrived at that the exhibit presents the number of people directly interested in slaves. A great majority of the persons represented in the table are heads of families, or agents for others having equal interest with themselves. It would probably be a safe rule to consider the number of slaveholders to represent the number of families directly interested in the slave population in 1860.

---

In concluding this introduction, we cannot but allude to the industry and capacity of Mr. JAMES S. WILSON, who has been charged with the supervision of the tables following, and to whom we are mainly indebted for that accuracy with which they have been prepared.
